Sorry to waste the bandwidth here people.

Jim if you are reading this or someone knows Jims new email address
can you urgently email me with it.

Jim, I will be in Tokoyo on Wednesday and Thursday this week, can you ring me
or email me your connact details (I lost them again [grin]) so we can
catch up .

Best regards

Jon (Z*NET Pacific) Clarke
phone (+64-9) 358 -1186, 358-5589.

I don't know if it works on the falcon or not, but I put a lot of trust
in Erin Matthew Monaco's programming skills last night, I tried his
program Blitzschnell out on my un-backed news drive (news is expired
every few days... not worth the hassel backing it up!).
Someone posted it to this newsgroup recently, strangly the manual
says it's Version 1.46 Beta Release, May 29, 1992. That's pretty
old!

Anyway, the program worked quickly, and defragmented the drive without any
problems.

4. NVDI Address

Newsgroup: comp.sys.atari.st
Date: 1994-04-01 01:10:56 UTC
From: tekmar@oar.net
Message-ID: <2nfsb0$ess@dialup.oar.net>
Source record: 189877

All,

I posted a message on c.s.a.s.t about a problem with NVDI ET/4000 on my Crazy Dots system. Basically the problem is that whatever Mod player I use (Paula, JunkBox, Desk Tracker) they all crash when I try to move the mouse around. No matter if I run the programs as PRG or ACC form.

I tried all combinations of things (TT Ram/No TT Ram) and nothing helped. I got responses from 3 other NVDI users who all have the same problem. So I think it might be a problem with NVDI.

Is their an internet address to contact the developers of NVDI and ask about this bug? I bought NVDI ET/4000 here in the USA from Gribnif, and they have never heard of this bug.

By the way. Its not the Crazy Dots Card. I can run the CD software and not use NVDI and the MOD players all work fine. Just no NVDI screen speed up. This is my only complaint about NVDI ET/4000 (well major one). I hope it can be resolved.

Oh by the way. One of the users with NVDI is running on a Mega STE with the standard ST/TT version of NVDI and not the ET/4000 model.

While it is true that they had a bad last quarter, you are also
ignoring that after this report was released Atari stock did not fall,
but indeed went up about a dollar. This is because Time-Warner thinks
enough of Atari to buy another 1.5 million shares...

Atari may have a dramatically reduced computer presence for awile, but
at least the comanies chances for survival look good at this point.

>Maybe the people at Commodore learned their marketing skills from Jack?
>Seems everything the Tramiels touch turns to shit, doesn't it?
>--

Well, to be fair, Commodore was a fine company when Jack was running it;
the Super-Pet was an amazing machine, bundled with compilers from U. Waterloo
and public domain software. Now, I can't express my opinion of his two goon
sons, Sammy and Lenny, without seriously violating the obscenity laws in most
states of the U.S.A. and probably elsewhere. Atari pessimism prevails, the
cynics claim the end is nigh; am I nuts for still considering a Falcon or TT
(or clone), given the fact that a lot of my software may continue to run?

[Note: a rhetorical question; I don't expect or want an answer.]

It's only a machine.

] emulator act a bit more like a vt100. Is that patch the storm02.lzh (appro
] file on wuarchive? Also, there was a posting a while ago which said to
] "apply the patches in order..." or something to that effect..

There are about 4 patch files for storm, you need the files:

storm.lzh
storm01.lzh
storm02.lzh

Ahh, I can't remember, there is a v1.01 patch, a v1.02 patch, and a
Z-Modem patch. The v1.01 patch file has the patcher utility built in,
so you just need to follow the instructions!

] 1. How do I 'uncompress'? the lzh files and make them 'usable'?

get 'lharc299.tos' from the atari/Archivers/ directory at
atari.archive.umich.edu and after running that you will have a nice
GEM-Based LZH utility with plenty of buttons to press! :)

There is also a TTP version which just involved typing into the dialog
box:

x -rh [Source path & filename] [Destination path]

e.g.

x -rh C:\TEMP\FILE.LZH C:\FILES\

] 3. Is there such a thing as a Jpeg/Gif viewer available?

Source record: 189884

] -Can anybody confirm the devellopment of a 486 emulator for the Falcon?

One exists, which apparently works, but could be better, and there's
a high quality one in the works.

] -Does anyone know if this will support PC-CD-ROM via scsi?

If the emulator gives access to the standard falcon SCSI port, no doubt
it will! Basically it's the Falcon equivalent of the ST's ASCI port,
and I know of no PC emulator which didn't support that!

] -Anyone heard about a 8MB RAM-board for the Falcon?

They handle 16meg without boards. And there are boards which let them
have over 100meg! (Rumored, I'm not sure if it exists). Confirmed boards
will give access to around 32Meg. The falcon at 16meg can only access
14meg of it due to the system using 2meg for bits 'n' pieces.

Andelain (andelain@xmission.com) wrote:
: 2. How do I 'apply' patches?

You're talking specifically about the Storm patches. There are at this point three: the Storm 1.01 upgrade, the Zmodem 1.01 upgrade, and the Storm 1.02 upgrade. They get applied in that order, using the patch program which comes with the Storm 1.01 upgrade. Instructions are in there, but I'll summarize briefly: run the patch program, select the item to patch, select the patch, save the result. This is a bit awkward because you have to have a list of the patches...

: 4. Is there a 'computer idiot' PPP/SLIP program available?

If you get a useful answer to this one, let me know. :-)

I just got an old 1040ST with one floppy, color monitor and mouse. I don't think I have any disks that come with it. I want to use it as a terminal. So I guess I need a good term program for this. Now here's the problem: I can probably FTP and download the term program from somewhere. But I need the term program itself to do the downloading!

I'm using and IBM PC compatible right now. Is there any way I can download the ST stuff and then write it into an ST formatted disk using my PC? This is getting really frustrating. If I have to, I'd have someone send me the disks. Of course that's the last resort. Sorry if this question is already answered in the FAQ, but I didn't see it.

Yes, Dan. Quite true. However, Atari is taking a step forward. I, for the first time, saw a Jaguar commercial today! It wasn't very good....but it was a first. It showed CyberMorph, Alien vs. Predator, etc. Perhaps if the Jaguar pulls Atari out of the muck, they will have more money to spend on the advertisement of their computers. I'm only hoping so because I am DEFINATELY getting a Falcon and I don't want to be left high and dry.

>--
>David Forrai gt1448b@prism.gatech.edu Opinions expressed are my own.

Although the software is likely doable - we must remember that what really makes the Atari different is not just TOS but also the hardware architecture (and the user community - but I am guessing that will remain no matter what :^)).

The ST hardware has not been hampered by the DOS machine's 8 Mhz 16 bit cards used for all external accesses. Instead we have many, many peripheral terminations for the ST right on the motherboard. And most, if not all of these terminations is supported by a special processor chip (unlike our Apple brethren who have the cpu handling every bit that moves with the cpu.)

Part of the power of our machines is found in the hardware - in its rather novel approach to how to marry hardware together. It's part of the reason that our 8Mhz ST running TOS (and WARP9 thrown in for fun) can do windows acceptably while a DOS or Mac struggles at 50Mhz.

Think about that a minute - 8Mhz vs 50Mhz. (BTW - to get a nicely detailed glimpse into the DOS architecture, I recommend reading David C Troy's excellent article "Riding the Bus", Current Notes Vol 13 No 10. That one article was worth the year's subscription in my books. It's a real eye opener for all your DOS friends - keep copies handy for their edification - believe me, they will give you much less grief after reading that.

Face it, we have neat software that can make our really neat hardware do really neat tricks. What more can you want in your computer?

So now you see why the tentative answer to the "yes, you could put TOS on a ppc machine, probably, along with DOS etc - but I wouldn't do it on the DOS machine, I'd want to put their OSs on an Atari

PPC. I have more faith in the Atari Hardware designers that they will provide me with a hardware architecture that will outlive the DOS one.

Not just a blinded Atarian, Wayne

In addition to ST TOOLS there is DL II ... I've successfully defragmented my
hard drive with DL II but have not yet really tried ST TOOLS. I can't quite
recall which ftp site I d/l'ed them from but I frequent archive.cs.ruu.nl
and wuarchive.wustl.edu so give these a try.

Ok, Mea Culpa: I didn't SEE the crosspost!

I said that the GE Software wasn't worth a dead cockroach, furthermore
there ARE some bugs in the adapter card itself, especially with
extensive SCSI use (like, hard disks will work fine, but I don't
know about Tape drives our CD-Roms).

ICD on the other hand works perfectly, and (as Ralph Sobek corrected)
their software works with any hardware (it doesn't need to recognize
an ICD board adapter online).

>OK, so you are French and can speak English......why shouldn't I know French...

Sorry about that, again!

>

Ah but the thing with this is that 4meg ain't enough for multi tasking and such like but 16meg costs far too much... I for one would love to get 8meg in my Falcon so that I can use MultiTOS for all development work.

I have heard about some 8meg boards but they are apparently a bit of a hack and tend to be slower than accessing 4 or 16meg of RAM, I don't know why this should be. Perhaps someone has one and can comment ?

Cheers

I'm trying to use FontGDOS with my BJ200e in BJ10e mode. I have the BJ10 driver installed and it works except that the page size is 8.5x10.4, not 11. I tried to install the FSMPRINT accessory but it won't load. I got all the files from the nic.switch.ch mirror of the umich archive. Any ideas? Has anyone succeeded in getting this kind of setup to work? Or, can anyone suggest a way to edit the BJ10 driver to change the page size?

Thanks and have fun! - Bob

md>tonight I discovered that you cannot format disks with this
md>desktop-replacement! Am I missing something or did the author miss
md>something?

Some desktops do and others don't have a format option. I did use
teradesk for some time, and vaguely racall it indeed not heving this
option. But there are plenty other possibilities: most copy-prgs can
be used to format, or more comfortable: use Universal Item Selector
(commercial fileselector replacement) it does have a format option, and
comes with a acc to use it from the desktop.
If you do have enough RAM and HD-space, i can advice Gemini (1.99) as
a desktop replacement: its the most functional with lots of extras
(incl format and integrated use of certain acc's) and comes with a
unix-like cli.

In a previous article, shirley@cybernet.cse.fau.edu (Samuel Shirley) said:

> Perhaps if the Jaguar pulls Atari out of the muck, they will have
> more money to spend on the advertisement of their computers.

Well, I wouldn't hold my breath waiting to see much in the way of
advertising OR a new Atari computer for quite a looooong time.
The only possible exception, IMHO, would be one built off of the
Jaguar, but it would still be a primarily games oriented machine.

Atari's computer division has consistently lost money for a long time.
The Jaguar has at least showed promise of being profitable (marketing
is another story... remember the Lnyx vs GameBoy?) If you were the
one in charge, would you continue to throw $$$ down a black hole or
invest in the one product that has turned a buck? Remember...

"Business is war." -- Jack Tramiel

Unfortunately, in this battle the USERS are suffering the most casualties
(and we developers, who are also users, haven't fared too well either!).

Time marches relentlessly on, and as much as we may hate it, things DO
change. Atari is simply adjusting to new market trends and attempting
to apply its technology in the best way it can to stay alive. That may
result in reduced or eliminated support for Atari computers, but that's
just life, people. Ain't no guarantees expressed or implied, ya know?

'Course, the above in no way detracts from the usefulness of your
current Atari computer. If it does what you need, enjoy it! And who
knows? Atari just _might_ come out with a new geewhiz computer someday.
But even if they don't, life _will_ go on. Trust me. ;-)

The best filesystem fixer-upper I have found is Cleanup ST, from ICD. The
one included with Diamond Edge is also good, but Cleanup has fixed stuff
that DE could not (for me). As for undeletes, Diamond Edge is more suited
for this (Cleanup does not have an undelete function).

You're wrong here. The '386sx is comparable to the 68030 in the Falcon,
which is also crippled by a 16-bit bus.

The '386 seems so much wimpier due to the hellish hardware surrounding
it...

> I suppose that at some point Motorola probably produced a processor
> comparable to the 80286, but the 68000 isn't it -- in spite of it being
> *older*, it's substantially *better*.

The '286 was useless, even by PC standards. The '386 (and the 68020)
introduced memory protection, which was ignored on Intel hardware 'til
OS/2 and the various PC UNIXes appeared.

The 8Mhz 68000 in an ST is as fast as a 12Mhz '286... 1 MIPS.

> In fact, the ONLY reason modern Intel chips have been rated as only ONE generation
> behind Motorola in power (i.e., 486 vx 030, 586 vs 040) is because the Intel chips
> can run at 3 times the clock speed. On a per megahertz basis there is no comparison.

"Modern" Intel processors (ex, '486 and Pentium) are comparable to
Motorola processors of the same "level" (ex, '040 and PPC 601) at the
same clock speed.

> For example, the PPC 601 has been rated under varying conditions at roughly
> five times the speed of a comparable Pentium, and yet Apple has OPENLY admitted
> that the 68060 is faster that the PPC601. It's the next generation PPC (Unsure if
> they were talking about the PPC 604 or PPC 615) that is supposed to beat the 68060.

I think your information sources are wrong; the PPC 601 is actually
slower than the Pentium at integer operations, and faster at floating
point operations. Slightly in both cases.

HOWEVER, due to the lack of registers on the Pentium (there are as many
in the '386 and '486) compared to the PowerPC 601 (which has 32 floating
point registers, and probably 32 integer registers; I think the Pentium
has maybe 16 registers _total_), "real world" applications are quite a
bit slower. Also, Pentium chips are usually embedded in these really
crappy motherboards, where the RAM and everything else is many, many
times too slow to keep up with the processor.

> But, to be fair, remember that you aren't comparing processors aimed at the

> HP-Workstations, and it was considered beyond reason that any individual
> could own that kind of power. (Look around you... the majority of all the
> old workstations still in use are 68020 based, including new X-terms.)

The 68000 was never used in Sun and HP workstations; the 68010 was used
in quite a few UNIX systems, including NCR's old TOWER systems.

> Intel based computers had the capability to enter the "modern-style" personal

> 486 came along that Windows were fast enough to change the IBM market from
> 8-bit style DOS programs (e.g. Word Perfect 5) to the "modern" mid-80s style
> interactive graphics/WYSIWYG platform.

And the hardware is still limping along with ancient things like ISA and
IDE hard drives...

> (BTW, don't you love all the marketing hype claiming that RISC is the "new"
> technology, and CISC is the "old" technology at the top of its performance curve? :-)

When they talk about things being at the top of the performance curve,
they're usually talking about the Pentium. The x86 architecture isn't
going anywhere fast.

The distinction between RISC and CISC is blurring real fast, just like
the distinction between workstation and PC is; when it was released, the
TT could be used as a workstation, but it's also a PC; 99.9% of the TT
owners out there have never seen Atari's UNIX. The average '486 system
sold today has more raw power (and less RAM, less hard disk space, and
wimpier graphics) than all those Sun 3's that are out there (which can
be had for $200 used!).

Prices only drop on this that are selling well; they can make the same
amount of money in total by selling more of them at a lower price.
Unfortunately, Atari systems aren't selling well enough for dealers to
survive at all, let alone make money by selling in volume.

GNU C does ANSI as well as "traditional" K&R-style C; there is also GNU
C++ that uses some of the GNU C stuff (the linker, etc).

GNU C++ is the only option for an Atari user who wants to do C++
programming.

You've got enough RAM and a hard drive, so I'd say to give gcc a try; 4M
of RAM isn't really enough for C++ programming, unfortunately, unless
you've got a really tiny shell you can use.

Ian Lepore's Heat & Serve C (based on Sozobon C 1.x) will work nicely on floppies in 1M of RAM. The library does have a bug though that will cause problems if you use Gemini 1.x or the Mupfel shell that comes with that version of Gemini. H&S C will be on atari.archive.umich.edu in atari/Languages or atari/Programming.

I _think_ Pure C (aka Turbo C in Germany) and Lattice C may work on such a small machine; they are commercial packages.

hello all you people out there in crt land,

i have a quick question:

how can i convert atari 8-bit discs with a bunch of ascii documents
to ibm format.

please reply by email to:
af338@cleveland.freenet.edu

thanx, (\)ick (\/)an

I've seen a couple of references to these packages:

INIT-1.1 - by ?
NFS? - by Ulrich Kuehn

Not much to go on I know ;-) however does anybody know exact filenames and ftp sites for these?

I've had a look arround 2 or 3 sites so far, but as I don't have proper filenames to go on its a bit difficult. Also I'm *paying* for every second I on!

:-)

Thanks

Roland.

Well, I was VERY unimpressed with the playable CE demo I got from ST
Format... No fun at all, but it looked nice and was highly rated in
the mags...

Is it legal to upload the demo for all to see?

Figuring that you have a GENIE account...wouldn't they know? :) *grin* i.e.
your Genie sysops...however...while not using Aladdin you can use the
ascii file upload for most terminals and send Genie the *up command.

The thing I used to do was to always keep one space after the sentence and
then a return...that usually set the layout straight I think...however
I haven't been doing that lately...

Roland,

Try initbin.zoo in the Mint/Utilities directory on umich. I don't know about
the NFS. There was a mount.ttp file in one of the Minix filesets I downloaded,
but I haven't looked at it yet. It's probably for tape devices.

>If the emulator gives access to the standard falcon SCSI port, no doubt
>it will! Basically it's the Falcon equivalent of the ST's ASCI port,
>and I know of no PC emulator which didn't support that!

Yes - but at what level? Surely for a PC CD-ROM system to work, the PC CD-ROM driver has to think there is a PC SCSI host adaptor in the system (eg Adaptec, Future Domain etc).

AFAIK ST PC emulators don't work down to this level. All they do is present a (PC) BIOS frontend to the SCSI port - allowing higher levels (eg DOS) to access the Atari's hard drives as if they were suported by the PCs BIOS.

As a CD-ROM is *not* supported by the PC BIOS as standard - I don't see how it is going to work.

(I hope that all makes sense - and please feel free to prove me wrong ;-)

Roland.

The Chaos Engine is excellent. Get it. But like their other games, don't
even think about solving it unless you have about 100 spare hours.

It's also doing quite well on the Sega platform, although they changed
the name to something more generic. Can't remember what it is.

>ga>BAD NEWS! Although the Falcon has 4 stereo channels to play around
>ga>with, only ONE channel can currently connect with the output at any
>ga>time!!! So, if you want to get more than one channel, then you'll
>ga>have to mix the samples in software. (Yet another use for the DSP
>ga>again!) Shame, really.

This looks like a reply to an earlier question of mine.. if not, my
apologies for butting in. Anyway, I didn't see the orginal of this so:-

Okay, you have to mix the 4 stereo channels - using the DSP for speed -
and then you play on one channel. Is it possible to Devconnect the DSP
output to the DMA sound so that anything that's sent out is played when
it's sent out?

That way I can see how I can play four sound effect tracks - where sound
effects have to be played at literally any time, ie not in sync. If I have
to send the DSP output to a '030 memory buffer and then use the XBIOS to
play it I can't see how it can be done. This would mean discrete 'mixed
sample tracks' which couldn't be changed once they had been set off.

Has anyone any ideas on this problem?

HELLO EVERYBODY, READ THIS PLEASE.
IT'S WORTH YOUR TIME, REALLY.

Not long ago, I got what follows in the News. It tells of how to earn easy money, fast!! Truly, it sounds too good to be true, but the potential loss is very small, so I for one am going to try it. And what I understand is that I need to persuade you to do the same. Honestly, I won't tell you that it works because I don't know. All I can say is that I (you) have nothing to loose but 5 (five) USDollars. What are five dollars? Are you sure you haven't looked under your couch cushions lately? If it doesn't work, at least I will have tried, and all I really will have lost is my five dollars, some stamps, and a bit of my time. Read what follows and make your own decision. :)

- D.E.

--*-

home except to go to your mailbox or post office.
In October 1988, I received a letter in the mail telling me how I could earn $50,000 dollars or more whenever I wanted. I was naturally very skeptical and threw the letter on the desk next to my computer. It's funny though, when you are desperate, backed into a corner, your mind does crazy things. I spent a frustating day looking through the want ads for a job with a future. The pickings were sparse at best. That night I tried to unwind by booting up my computer and calling several bulletin boards. I read several of the message posts and than glanced at the letter next to the computer. All at once it came to me, I now had the key to my dreams.
I realized that with the power of the computer I could expand and enhance this money making formula into the most unbelievable cash flow generator that has ever been created. I substituted the computer bulletin boards in place of the post office and electronically did by computer what others were doing 100% by mail. Now only a few letters are mailed manually. Most of the hard work is speedily downloaded to other bulletin boards throughout the world. If you believe that someday you deserve that lucky break that you have waited for all your life, simply follow the easy instructions below. Your dreams will come true.

Sincerely yours,

Dave Rhodes

INSTRUCTIONS:

Follow these instructions EXACTLY, and in 20 to 60 days you will have received well over $50,000.00 cash, all yours. This program has remained successful because of the honesty and integrety of the participants. Please continue its success by carefully adhering to the instructions.

Welcome to the world of Mail Order! This little business is a little different than most mail order houses. Your product is not solid and tangible, but rather a service. You are in the business of developing Mailing lists. Many large corporations are happy to pay big bucks for quality lists.

(The money made from the mailing lists are secondary to the income which is made from people like yourself requesting that they be included in that list.)

1) Immediately mail $1.00 to the first 5 (five) names listed below starting at number 1 through number 5. Send

CASH only please (total investment $5.00). Enclose a note with each letter stating: "Please add my name to your mailing list." For other countries the equvielent amount may be sent, e.g. in Hong Kong Send HK$10 as this is the lowest denomination note.

(This is a legitimate service that you are requesting and you are paying $1.00 for this service).

2) Remove the name that appears number 1 on the list. Move the other 9 names up one position. (Number 2 will become number 1 and number 3 will become number 2, etc.) Place your name, address and zip code in the number 10 position.

3) Post the new letter with your name in the number 10 position into 10 (Ten) separate bulletin boards in the message base or to the file section, call the file, MAKE.MONEY.FAST.

4) Within 60 days you will receive over $50,000.00 in CASH. Keep a copy of this file for yourself so that you can use it again and again whenever you need money. As soon as you mail out these letters you are automatically in the mail order business and people are sending you $1.00 to be placed on your mailing list. This list can than be rented to a list broker that can be found in the Yellow Pages for additional income on a regular basis. The list will become more valuable as it grows in size. This is a service. This is perfectly legal. If you have any doubts, refer to Title 18, Sec. 1302 & 1341 of the postal lottery laws.

NOTE: Make sure you retain EVERY Name and Address sent to you, either on computer or hard copy, but do not discard the names and notes they send you. This is PROOF that you are truely providing a service and should the IRS or some other Government Agency question you, you can provide them with this proof!

Remember as each post is downloaded and the instructions carefully followed, five members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the number five position you will be receiving thousands of dollars in cash.

-

The following letters were written by participating
members in this program.

-

To Whom It May Concern:

About six months ago I received the enclosed post in letter form. I ignored it. I received about five more of the same letter within the next two weeks. I ignored them also. Of course, I was tempted to follow through and dreamed of making thousands, but I was convinced it was just another gimmick and could not possibly work. I was wrong! About three weeks later I saw this same letter posted on a local bulletin board in Montreal. I liked the idea of giving it a try with my computer. I didn't expect much because I figured, if other people were as skeptical as I, they wouldn't be too quick to part with Five Dollars. But, I buy lottery tickets weekly in my province and have nothing to show for it but ticket stubs. This week I decided to look at this as my weekly lottery purchase. I addressed the envelopes and mailed out one dollar in each as directed. Two weeks went by and I didn't recieve anything in the mail. The fourth week rolled around and I couldn't believe what happened! I can't say I received $50,000, but it was definitely well over $35,000! For the first time in ten years, I got out of debt. It was great. Of course, it didn't take me long to go through my earnings so I am using this excellent money opportunity once again. Follow the instructions and get ready to enjoy.

Please send a copy of this letter along with the enclosed letter so together we can convince people who are skeptical that it really works!

Good Luck,

Charles Kust
St Agathe Que.

Another letter:
I tried a similar program in which the cost was $5.00 per response. In that one the return was about 3%. Since I did not have a modem I sent out letters regular mail. I created a few mailing labels and printed out all of the labels on pressure sensitive tape. The first mailing that I used the $1.00 dollar per reponse approach I started to get return mail in just over one week! I sent out 200 letters instead of 100 that is required if you use the mail instead of the bulletion boards. Additionally, I included as many friends, relatives, classmates, that I could think of in order to encourage their participation if they happened to recognize my name, so my percentage of gain was higher. I am trying again with 500 letters to see if I surpass the $141,000 of the last time. You just won't believe it until you try.
Best Wishes,

Mark Garner
Dallas Texas

Additional Notes:

This system works equally well if mailed out manually. Mind you it takes more effort to hand address the envelopes and the cost goes up proportionately to cover the postage and envelopes. You must also photo copy the instructions, cross out the name in number one position, write in your name in the number ten slot and change the rest of the numbers accordingly. (It might be neater to use white out or paste over the names.) In order to achieve the same results you must send out the $1.00 dollar to the first five names and then send out another 100 letters with copies of the program enclosed. It has been suggested not to put a return address on the outside of the envelope in order to encourage the recipient to open it. The return will approximate that then received from the posts listed on the bulletin boards.

Hello, my name is Steve Prester. As you may have noticed I'm the tenth name on this list, so I do not have a rags-to-riches story to tell here. However, I did make a phone call to the 2nd name on this list, Ernest Goyette. Did he have a rags to riches story to tell? Not exactly, but then I found out that he did not follow the instructions precisely. You see, Ernest lost faith in the program before he had finished following instructions. He only uploaded this file on one BBS, which happens to be operated by Darryl McGinnis, the 3rd name on this list. Ernest told me that he has received $92.00 to date (1/6/90). I realize this is far from the $50,000.00 promised at the first of this file, yet one must keep two things in mind:

1. $92.00 is almost 10 times his initial investment, and it only took about an hour of his time (there's nothing to lose).

2. This program works mathematically on an exponential scale. In other words, for every one BBS that this file is uploaded onto, it should spread to at least ten other BBSs and possibly a whole lot more. So, if Ernest had uploaded his file on all ten BBSs, he should have at least gotten a hundred-fold of what he has, which would be $9200.00. Not bad for a few hours work and a $6.25 investment (including postage).

Finally, I would like to exhort those who become involved
in this program to maintain its integrity by being honest.
It is the only way that it can possibly pay off. In other
words, be sure to enter your name at the bottom of the
list and not in one of the top five positions (actually
this would be robbing yourself since it is while your name
is in the lower positions that it gets multiplied
exponentially over hundreds of BBSs). And, of course,
send your $1.00 off to the first five names. As I write
this I have not made a penny (that's because I have not
uploaded this yet), but I thought you might like to hear
from someone at the bottom of the list, instead of someone
claiming rags-to-riches. I hope such is true, and I'm
sure it will be if we all stick with it. The potential is
definitely here!

P.S. Call me if you get rich.

Hello,
I am the current #10 on the list, I too am sceptical.
Well what do we all have to lose. It is worth a try
in order to realize some substantial gain. Don't any of you
out there want to upgrade your PC's. I certainly do, but
can't afford to. I hope that this program will make enough
cash in order to buy a super system.
Nua Nicaj

Hey There! Glad your thinking about this seriously because
I am! If all these people are making money then why not be
included with them and get some also? I'm going to be #10 on
this list, and Im uploading it everywhere! If you have the
access :) then follow through, upload it, and see what happens!
Hey, Imagine earning enough to buy a 486? or one of those high
speed modems that cost hundreds of dollars? What about buying
your OWN BBS ? Who wouldnt want to be the Sys-Op of their VERY
OWN board? I know I wouldnt mind :) What do you have to lose
but 5 bucks compared to the hundreds and thousands you CAN make?
I know Im down.. Will you be the very next to EARN some cash?
Talib Khan

Hello, I'm Stephanie Kemach and I am now the tenth person on
this list. I'm trying out this idea in the hopes that it will
pan out, but I've never seen anything like this before. Still,
for a meager investment of $5.00, what do any of us have to lose?
It's worth a try and I'm trying it out now. Good luck to everyone
else who uses this great-looking money-making idea.

This is John Gibbs, call me Gibber. Stephanie is no longer the
last on this list, hopefully I can say the same soon. I agree that

the investment is quite meager, let's see if everybody can benefit
from it. Just a note that Canadians will be happy to accept
American money at par if it is possible. Good luck to all! Bon
Chance, Au Revoir.

Hi this is Jurgen Kreisel, please add my name to the mailing list.
I am the new kid on the block as the last person on this list. I have
always been told that if it sounds to good to be true it probably
is, but what the hay I can blow 5.00 at the video store and get
nothing for my money either. Well here goes nothing.

Hi! I guess I'm now No#10. I have never done anything like this before.
I never even reply to chain letters. I guess I am doing this one coz I
think its actually gonna work. If it doesn't I simply lose a bit of
money (which I probably would have lost at the race meet tommorow
anyways). Time to find out if this thing really works....

Well gee shucks! ...i guess i'm now the 10th dude on this list, as always
u might feel that this is NOT going to work and that people are not gonna
start doing this crap and mailing people money, but hey! ...it's only 5
bucks US isn't it? ...what've u got to lose eh? i'm certainly gonna try since
right now a bit of money wouldn't be bad while trying to get into a good
university with all the hassles of school!
...seeya lateR! =)
Sanjay Purswani
09/02/93

Hi! I guess I'm No#10 now.I think it is a interesting game for me and u to
have a money making.I have never heard it before,but,at least,i believed it
can let me to upgrade the computer.

Well! This chain letter can give me a hope ,it just cost me $10.
if it is workable,I have many times of this $10.So try this.
It is hoped that the result will be appeared as fast as possible.

Now, I am No.#10.!!!!! I think this chain letter
investment is quite interesting......and worthy...
So..I try it now.....and It can help anyone to upgrade
his computer only by investment of "US$5.00" or "HK$50.00".
Finally, Anyone see this mail, please join this activity..
and please be honest!!! Don't add your name at the top 5 instead of
the bottom of the mailing list!!!!!!! Furthermore, Please send the
money to the first 5 people!!!!

Kit, 13/2/1994

Do everyone want to try this!? It is quite interesting.
I try it now.

Cindy 14/3/1994

And another is added to this list. Me being the the 10th now. Best
of luck to all. Let's see what happens...

Dan Evans - March 31, 1994

we>If the emulator gives access to the standard falcon SCSI port, no
we>doubt it will! Basically it's the Falcon equivalent of the ST's
we>ASCI port, and I know of no PC emulator which didn't supportrtr!

That would be nice. I wonder if anyone ever tried this (say, '7th
guest'-cd for dos on a falcon).

we>] -Anyone heard about a 8MB RAM-board for the Falcon?
we>
we>They handle 16meg without boards. And there are boards which let
we>them have over 100meg! (Rumored, I'm not sure if it exists).
we>Confirmed boards will give access to around 32Meg. The falcon at

Maybe i should explain myself: i would like 8MB becourse 4 is not
enough for serious multitasking, and 16 costs a lot of money, and is
more than needed for normal use.

we>16meg can only access 14meg of it due to the system using 2meg for
we>bits 'n' pieces.

I thought the 2MB was disabled for compatebility reasons, something to
do with the rom-cartridge port. A shame though: sitting there,
costing money and doing nothing.

60. Mod Player & .SEGM Files

Newsgroup: comp.sys.atari.st
Date: 1994-04-02 02:24:23 UTC
From: hsp4@columbia.edu
Message-ID: <2nil0n$mi5@apakabar.cc.columbia.edu>
Source record: 189933

I have 2 questions. I'm using a MSTE 4/Mono (coproc. installed) and I'm looking to find a way to improve my MOD enjoyment...

1) Since ProTracker won't run on a Monochrome monitor, what's the best player that I can use? I find that DeskTracker doesn't sound that great (it appears to not use interpolation). Paula and Jukebox will do interpolation, but won't play over 12.5MHz on my MSTE (16MHz with Cache on mode)--25MHz interpolation only works for a couple of seconds. I'd kill for a DA Mod player, but I'll settle for a .PRG.

2) Supposedly NT_COMP produces .SEGM files which run 100% on the DMA chip. When I d/l'ed NT_COMP2 from aaue and tried to make it work, no matter what I did, I got an out-of-memory error (and I was testing it with a 10K .MOD [4mat]). Is it possible to make it work, and if so, how is the sound quality of the .SEGM files (I can play them with Jukebox). Barring that, where can I find some .SEGM files.

Thanks a lot.

61. Weaning off of my Atari's

Newsgroup: comp.sys.atari.st
Date: 1994-04-02 02:58:38 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <1APR94.21583822@cc4.crl.aecl.ca>
Source record: 189934

I am, and will probably remain, a die hard Atari fan. I make good use of my Mega4ST (TOS 2.06 and AdSpeed 16) and SLM605 at home and I still use my TT and SLM804 at work for graphics. However, sad, but true, the world has passed Atari by.

While I have been using a Windows 3.1 system for about two months and have hated the interface, there is no getting away from the fact that systems have to network to be effective business tools. Soon to be gone are the days when everyone goes scrambling for files on employee X's machine when he/she is away, quits, is fired or dies!!! Going are the days that users feel an ownership to their files - they belong to the corporation!

For large companies, document and information management will be the key to competetiveness and survival. Soon users will be checking their files into and out of central "vaults" that ensure accessibility, facilitate creation and updating, streamline approval, and assure retrievability.

Yes, I still use my ST and TT for utility chores but there is such a huge advantage in networking (common software, common mass storage, consistent support, etc.) that I can *almost* forgive Microsoft for having given us a legacy of DOS (and its myriad of versions), Windows 1 through 3.1 (damn I hate the File Manager!), the early forms of BASIC (the antithesis of a programming language), the first version of MS Chart (which to several minutes to update a chart on an XT), and so on. Now we have Word (unfortunately, I am forced to use word perfect in my workplace), EXCEL (equally unfortunately I have to use 123 for WINDOWS and find myself using the old slash commands to do the job), ENCARTA, Visual BASIC, ... Finally, the INTEL based computing world is beginning to get software as easy and fun to use as Mac and Atari users (oh yes, and Amiga users) have grown up with since '84/'85.

Sadly, I will be weaning myself off of my Atari ST and TT. I bring my 486 laptop home to work and drop it back in its docking station during the day to get back on the net. Kind of makes it silly to get onto the Mega (but that's what I composed this posting with). I will probably pick up a Power PC within a year to get full swing into Multimedia now that my daughter will be entering high school (Jeez, I'm an old fart!)

So, die-hard Atari fans, keep on computing with TOS systems. I hope support for TOS systems lasts for some time to come. It will be a shame to see the Jackintosh die too soon before its time. After all, I sold a couple hundred 520STs, 1040STs, 1040STEs, and Mega STEs as well as 10 TT systems and my heart still has an attachment with those beasts.

Yes there is a ver 2.0 and it's great! Even though as I look at the disk
It is also dated 1987.. A few year ago I contacted Interstel for a "PC"
friend who wanted the program and they said that they don't support the game
any longer. Your best bet is to look for software closeouts and the like. Or
buy it used.. I'd sell you mine but I love it too much and I don't condone
piracy... and I'm sure you don't either :-) Good luck in your search!!

Oh BTW there is a real cool Empie! like game called Conquest that has more types
of weapons, bombers that bomb, AAAs, and is Falcon compatible at Hi
resolutions.I got it off Delphi!

Rob

: Mickey> remember that I don't have is The Chaos Engine. Is it work
: Mickey> getting? My guess would be yes, but it never hurts to check
: Mickey> :-).
As a fan of the Bitmap Bros., I waited with impatience for several
months for it to get across the Atlantic. It had very good reviews
in the British mags, and great screenshots, not to mention the good
reputation of the Bitmaps.
Having said this, I ended up liking Gods better. However there are
some pretty good features that make it worth getting. The best in
my opinion is the two player/two joystick option. It is similar to
Gods and most scrollers in gameplay, i.e. powerups, monsters always in same
location etc. Like Gods it doesn't have a save feature. I've only been to
the fourth level of the first world so I don't know if there are end of
level monsters. I assume like Gods it must use end of level passwords.
The graphics are excellent (as they were in Gods). It's a three
dimensional playing area. You get the choice of one of six characters
with varying weapons and "personalities". There are usually two characters
in play. In the single player version, the second character is run by
the computer. In the two player version each player gets a character.
It has been ported to multiple platforms. I was more than a little
shocked a couple of weeks ago to see an ad on tv for "Sega's game of the year"
called Soldier of Fortune or Mercenary or some such action/adventure type
title. Sure enough it was Chaos Engine retitled to American tastes.
If you like the Bitmaps and Gods in particular, I would definitely
recommend it.

: Well, I was VERY unimpressed with the playable CE demo I got from ST
: Format... No fun at all, but it looked nice and was highly rated in
: the mags...

Well as a regular reader of ST Format, I got both the Gods demo,
and the Chaos Engine demo. The Gods demo was truly excellent, a standalone
mini game worth the bother of playing, with enough variation from the
first level of Gods, from which it was taken, to make it an independent game.
The demo version of C.E. was not as good a reflection of C.E. as was
the Gods demo of Gods. The two player option was disabled, and you were only
allowed to use two of the six characters (always the same two). Unlike
the Gods demo, it is not really an enjoyable stand alone game, but rather
a simple demo. It is not very challenging and it is completed too easily. A
so-so demo, but the game is substantially better.

: Is it legal to upload the demo for all to see?

Since most of my software (good or bad) come from the ST mags, I think
this is an important question for more reasons than one. They are a good
supplement to the archives, and easily accessible if you have a dealer.
Particularly valuable if you have no net access.
I suspect that Ofir Gal can answer this question in great depth.

DNP

You forgot Magic Pockets, another Bitmap Bros game (also with music by Nation XII) It's a platformer, but well done. Takes forever to get to the end, and there's no guarantee you'll see the end, either, since it's incredibly hard to do. (And if you don't get it on the first try you're pretty much SOL)

>it to 1.09, which brings me to another question: Is there any (real)
>support for Lattice yet? (ie MiNTlib binaries, Lattice specific source
>etc.)

People are welcome to make binaries of the MiNT library available. I
don't have the facilities to make such binaries myself. Buy me a copy
of Lattice C and I'll be sure to post binaries along with the GCC
binaries :-)

The Lattice C support is probably going to be a little shakey for a
while, as the Lattice library co-maintainer just had a hard disk
crash...

Cheers,

DATE: 02.April.1994
FROM: AM.SIG
RE: *_Cola submissions...

/* Additional Info available, email for information */

In recent weeks, a new series of ray-traced rendered graphical images
of Animation charactors and scenes were created and uploaded to
a ftp site. This series has proved to be more popular than previously
anticipated and numerous requests was received to have similar/identical
images in formats other than what we believe to be popular Video Toaster
FRAMESTORE format.
Because our system is on a 20hour/day schedule working from hardware
design, IC circuit design, general word processing and desk-top-processing,
and of course, Graphical modeling and rendering; we do not have the time,
nor do we have the capacity, to convert all images we created to other
formats. Furthermore, any conversion of the image format was found to
have an unacceptable amount of imag loss.
In view of the diffuculties above, we have decided to 'license' out
creation rights of this concept to other fans/graphic artists for their
respective platform. The only requirements are that you have to prove the
below:
1. You are capable of creating similar images/animations
with same or better quality than our FRAMESTOREs/anim.
2. You are devoted to create similar images/animations with
the same or better quality than our FRAMSSTOREs/anim.
3. Submission of a sample rendered image/anim to us in a
format which is compatible for us for quality check.
4. Written permission from us for the concept.
5. Your rendered images are for non-commercial purposes.

Please note that the basic requirements for the images are industrial
NTSC resolution (752X480) or above, 24-bit pallette or better, ray-tracing
with full utilization of reflections,refractions,shadowing, and transparancy.
The basic requirements for Animations are industrial NTSC resolution
(752X480) or above, 256,000 color or better, ray tracing with full utilization
of reflections, refractions, shadowing, and transparancy. In addition, the
animation has to be set at and be able to be redisplayed in realtime with
full colors and resolution at 30fps/60 fields per second.
So far only two computer platforms are covered, Commodore-Amiga
(the original format), and IBM Compatible. We are searching for other
platform compatibility like Acorn, Atari, SGI, UNIX, NEC, Cray II+. If
you need or wish more information concerning the *_Cola concept, please
email to us at: thwang@mentor.cc.purdue.edu

-TKH '94
Chair, AM.SIG

NOTE: We are not seeking direct Macintosh compatibility because Macintoshes with the proper and commercially available hardware/software combination can easily view the original FRAMESTORE format.

NOTE2: Currently rendered images can be found at venice.mps.ohio-state.edu in the directory: anime-mange/new, or anime-manga/sorted/KimagureOrangeRoad/Images. Their titles are: 101.FS.KOR_Cola.lzh, 102.FS.KOR_Cola.lzh, and KOR_Cola_11.Zip.

If you read the documentation, it says that WINX can be used WITHOUT GEMRAM on TOS versions 1.XX, but that it was a limited set of patches, and only required 16k. This was the mode I was inquiring about.

I can't answer in depth. Basically, check the docs. Some programs and demos are not PD. The magazine pays for having it on the cover disk. Next month's ST Review has a special version of GEMView for example. The version is semi-registered, you do not get the delay dialogue of the Shareware version and it doesn't time out after 30 days. The only limitation it has is that you can't upgrade it. This version SHOULD NOT be uploaded.

Source record: 189950

In a message dated 3-19-94, Neil Francis asked:

"Does anybody know how to go about reading ST format floppies
on an IBM PC?"

Have you tried sticking it in the drive and seeing if works? The ST uses the same format as the IBM. However, sometimes a PC may have trouble reading it for various reasons (i.e., custom format, lack of PC boot sector if formatted with an older version of TOS or some utilities, etc.).

The best solution is to format a 720K floppy (assuming your ST lacks a high density drive) on the target PC, and use that for the transfer. The ST should have no problem at all.

If that is not an option, obtain and use the program FDFORMAT for the PC, and use its FDREAD utility. In my experience, this allows most any PC to read most any disk that can be formatted on an ST. (This program should be in the libraries of most commercial services, BBS's, etc.).

Message-ID: <hlzsp3s.lmcclure@delphi.com>
Source record: 189952

In a message dated 3-30-94, Roger Sheppard asks:

"Hi does any one know how to upload a Text file to GEnie,
with out using Allading, (would take me weeks to work out how
to use it), with out loosing the Format of the letter.."

You can do it one of two ways: (1 Make certain each line starts with at least one blank space. (2)Use "*sn" to save the message when you are finished instead of "*s".

To avoid blank lines being dropped, use at least one space before you hit return.

If you happen to be uploading using Flash, I recommend going into the "Edit" menu, select "Ascii UL/DL", and set "strip linefeeds" to on, "Metering" to off, and "Prompting" to on, and type in a ">" for your prompt character. It works for me, albeit with one side effect; I have to hit return once when it is finished, otherwise it does not recognize the "*s" (or "*sn" command).

You don't want to connect the DSP transmit to the DMA channel, that wouldn't play the sound just enable you to record it. Instead DevConnect the DSP transmit to the DAC and voila we have sound coming out the headphone socket. As to playing sound FX from the DSP I don't know how much stuff you'd be able to get in it's memory, all depends on the quality really.

Hope that helps a bit (if not post again and I'll get my thinking cap on)

Cheers

Ian

Atari doesn't want MiNT binaries past, uh, hmm, I forget the version
number, distributed. The binary currently on atari.archive is the last
one that can be distributed in binary form.

This is mostly due to the fact that they don't want to support it unless
you've bought MultiTOS (which comes with a slightly buggy MiNT 1.04).

As I remember BOXKITE also allows to pass more than one file to an
application. It's very similar to Selectric and knows to handle long
filenames.

It is possible to do a batch upload with the internal ZModem of
CoNnect.

Remember: You only can send 30 files at once due to a limitation in
Selectric.

The init package is by Stephen R. Usher and Dave Gymer. There is acctually
the Release 1.1 source distribution (9th August, 1993) available. The
file is usually called inisrc11.tgz. As I remember it's available from
a.a and several German ftp-servers. There are no binaries available.

Excellent - this makes a lot of sense. The problem with DSP memory can be coded around. Just write code which processes data coming in (ie up to 8 mono discrete 16-bit samples), mixes it and sends it to the DAC. Voila. Will it work in practice? No idea.

Anyone know how the DSP will receive the different samples? Over the HSR/HRX thing? I guess I just send the sample data myself, in whatever format I like. For some reason I was thinking about using the Xbios DMA sound playing facility connected to the DSP - but I guess that's invalid.

Finally - in this rambling stream of consciousness type message - it looks like I have to somehow cope with the timing of the playback myself. Unless, i can make the DMA sound 'play' 8 mono tracks into the DSP.

Graeme

91. genmagic.c in MiNT108

Newsgroup: comp.sys.atari.st
Date: 1994-04-02 16:38:48 UTC
From: azog@world.std.com
Message-ID: <Cnn4wo.7zp@world.std.com>
Source record: 189964

I see by other articles in this newsgroup that I am perhaps two releases behind, I am trying to build MiNT 108 and see people talking about 110...

Anyways, using GCC240, patch level 20 (old) of the GCC MiNT libs, I am having trouble with genmagic.c in the source, that it returns with an undefined symbol ___MAIN referenced from text (!). Seeing as I am using a pretty stanard setup, altho a little old, I am wondering if anyone else has come across this error?

(perhaps a little later, Ill download a newer release of the GCC MiNT libs, but I am lazy... could this be causing my problems?)

Thanx

IS there a Public Domain or Shareware editor for the DX-100 and ST
availble on the net. I have seen them for the TX81z and the FB01 but not
the DX. I have tried both the TX81z and FB01 editors and neither of them
work with the DX. Infact the docs for the TX81z explicitatly state that
it will not work with any DX series synths. If you know of a site I can
FTP an editor from let me know ASAP.
Thanks in advance!

94. ST Xformer help needed!

Newsgroup: comp.sys.atari.st
Date: 1994-04-02 18:26:51 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.94Apr2132651@wpi.WPI.EDU>
Source record: 189967

As an old 8 bitter as well as a modern (?) MSTE'r, I'm interested in getting ST Xformer working.

I realize that Darek has moved on to Microsoft and Gemulator and is no longer supporting ST Xformer, but I was wondering if anyone has any documentation (or even a text file) for the PD version, 2.55, which can be found on c.s.a.s.

Particularly, how does one _create_ a virtual hard disk? And how does the stxfp program work? And does the modem port work? I wouldn't expect support for the SCC port, but the MFP does, right? And has anyone had problems with crashes on non-STs? (ie STE and beyond)

Also, is there support for cartridges at all? Or an 8-bit program to transfer carts to programs on disk?

In general, any help at all would be appreciated. I plan on checking GEnie's library myself for any info, but if anyone else has already done this some pointers would be nice!

Thanks,
.s.

Source record: 189969

```
] tonight I wanted to format a floppy disk. I am using TERADESK and tonight
] I discovered that you cannot format disks with this desktop-replacement!
] Am I missing something or did the author miss something?

The author left it out. There are plenty of small & good PD disk-formatters
laying around on FTP sites. Including a formatter would add a fair bit
to the code, so if it's easilly available in another form, why bother!? :)
```

:>Anyone know how the DSP will receive the different samples? Over the
:>HSR/HRX thing? I guess I just send the sample data myself, in whatever
:>format I like. For some reason I was thinking about using the Xbios DMA
:>sound playing facility connected to the DSP - but I guess that's invalid.
:>Finally - in this rambling stream of consciousness type message - it looks
:>like I have to somehow cope with the timing of the playback myself.
:>Unless, i can make the DMA sound 'play' 8 mono tracks into the DSP.

ok... say you want to play 8 channel stereo sound on the Falcon,
obviously 96kb of DSP memory isn't going to be enough to store all your
samples (your average 4 channel mod is 100++kb), the solution is store
the samples in conventional memory and then send the sample as it played
by the dsp (the dsp tells the cpu how much of the sample has been played
and therefore how much to send). For each channel the DSP requests to the
CPU how many more sample bytes it requires, it is then upto the CPU to work
out where in the sample it is -> i.e. the DSP just treats each sample as
a stream of data. The actually DAC can be driven from a circular buffer
which the DSP then updates with this new data. In my DSP tracker this
'new data' consists of the sample data that has been shifted in frequency and
volume and smoothed.
Obviously using the HOST port involves using the CPU and sending each voice
takes some time but NOT that much.. to do eight channel stereo sound it
uses about 14% cpu time... or 10% if you cheat.

I'll upload FALCON PLAY 1.4 (FALCPL14) (modplayer with source) to the
atari archive and some of the other popular FTP sites in a week or two. It
plays 4/6/8 channel mods in 50khz interpolated sound, I hope the source will
be of use to all these people asking how to mix sound with the DSP.

[...]

Well, seems I remember that Atari ended up buying the full rights to the Atari GEM package from DRI after the debacle with Apple lawsuits resolved itself somewhat, and this is why a complete rewrite of the TOS 1.x (beta) versions of AES could appear as TOS 2. So Atari _does own_ AES.

:EMILY: ??.??.??
Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of _humor_.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways), Emily has taken time out of her busy schedule to answer a few commonly asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.

Flame wars are fun. They're the main reason people creted Usenet,
and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV: 93.06.11
How do I become a developer for the Atari ST?
==========

Contact Bill Rehbok, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Bill can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Bill for

more information.

Atari is now selling the developer's kit (or parts of it) seperately. No project-in-development or non-disclosure agreement is necessary.

What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4

```
Access denied..................-36.............5
Invalid handle.................-37.............6
Insufficient memory............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified........-46............15

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't

post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to
myself via the e-mail addresses above or by writing the SIG at its US
mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

:MAGS: 93.09.04
What magazines are available for the Atari ST?
==========

If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.

As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in
all local WaldenSoftware stores and many bookstores. If your "local"
Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby
<kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only
non-games mag in the UK (although see ST World below). Approx. 4,500
copies per issue sold. News, reviews, interviews, tech tips, general
forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a
'user-driven' feel. Recommended. The associated ST Club runs a PD
distribution service and distributes a couple of commercial programs too
(Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

12 issue Subscription now:
With Disk 6 Mags Without Disk Mags

UK: #26.50 #18.00
Europe (air) #30.50 #21.00
World (air) #38.50 #31.00

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly
'buyer's guide' in Autumn 90.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people.
Lively, but of uneven quality. Big leisure section, but other areas
covered too. Includes cover disk - mix of games demos and (usually out
of date) PD utilities. Probably the biggest-selling UK ST mag. Has had
several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011
Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought
to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so
polished. 1 cover disk per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't
have their names.

German Mags:

ST-Magazin, TOS, and ST-Computer united in August 1993 to the
"ST Computer", which is the only remaining magazine in Germany.
(I don't know if the following info still holds, then. --Steven)

ST Computer:
---
11 issues/year, typical around 180 pages
Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)
Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French Mags:

ST Magazine

Monthly in French. Oriented towards developers, professional users. Comes
with a disk each month.
ST Magazine - 10, rue Hegesippe Moreau - 75018 Paris - France
(French Teletel users: 3615 Teletel access, code STMAG)

STart Micro

Monthly, includes a cover disk. 11 issues per year. 64 + 16 (separated) pages.
Price: FF38 per issue, subscription: FF360. Subjects: Desktop publishing,
graphics, initiations to C and GFA Basic, survey of outcoming software, music,
folders. Minitel access: 3615 code ATARI. Address: FC Press, 57 rue Danton,
92300 Levallois-Perret, France.

Dutch Mags

ST, published by Stichting ST , postbus 11129 2301 EC Leiden the Netherlands
---
cover price: fl 6,95
Independent magazine by and for atari ST users.
covers all different topics from applications to games and hardware.

60 pages.

6 times a year. One year subscription fl 35,-
black and white pages.

Atacom, by Atari Club Groningen.

Never seen this one. I suppose you have to be a member of the club or so.
price is fl 4,95.
Adress of the club: Atari Club Groningen, Postbus 9164
9703 LD Groningen, the Netherlands.

Atari Nieuws, by Atari ST computer club Nederland

News paper sized publication. Lots of colour on newspaper pages. Not too many
pages though.
price is fl 3,95 (cheap cheap)
monthly publication.
adress: ACN, Postbus 5011, 2000 CA Haarlem, the Netherlands.

GFA-info, by GFA gg (usergroup)

Publication of the GFA-basic usergroup. This group has a lot of mainly
educational software available.
price is fl 5,00

adress: GFA gg, Frankrijklaan 14, 2034 BA Haarlem, the Netherlands

ST News, by Stichting Computers Eindhoven

This is an electronic magazine. It has been around for about 6 years now
and is completely in English!!! The first issues were in Wordplus format
back in 1986 but from the 6th issue on it included a readerprogram
both for color and monochrome. Even with music.
price is fl 10,00
adress: S.C.E., Kornoeljelaan 22, 5552 RC Valkenswaard

Swiss mags:

Atari ST News Schweiz

Dutch Atari ST Nieuws translated into German for the Swiss :-)

:TIPS: 93.06.11
TIPS AND HINTS from other users
==============================

Any 'multisync' monitor which handles 70 video fields a second can be used
with the ST; the custom cable involves no tricks, or commercial ones are
available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are
tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0). This can be done with either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

On the Desktop, holding the right mouse button allows you to manipulate files in other windows. This is useful for a number of reasons. An example is this: say D:\BLAH.ARC is a file you would like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then hold the right button while double-clicking ARC.TTP in an inactive window.

:ZNET: ??.??.??
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR: ??.??.??
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

Atari Explorer Online and some information from the Current Notes user
magazine are also available from the atari.archive server under
/atari/magazines.

:PD: 93.06.11
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ZIP, .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP: 93.05.05
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu in /computing/systems/
atari/umich.

:COMP: 93.10.02
Atari-related companies
==========

This is a (still under construction) list of companies and addresses that
might be of use to Atari ST users. Please send me addresses for the blank ones
on this list. See also IAAD, it lists many more companies that are not on
this list.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
TT, and Falcon. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.
```

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS: 93.06.11
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC, .ZIP and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ZIP Use UNZIP.TTP or STZIP.PRG
ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

stzip22.lzh - STZip, with GUI interface

unzip41.lzh - Old version of unzip

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using
zoo21.ttp.

:MSA: 93.06.11
Some info on Magic Shadow Archiver
==================================
(This was provided by Chris Herborth)

MSA Archives

The Magic Shadow Archiver (MSA) is a disk archiving program that allows an entire disk to be compressed into one file for transmission. The Magic Shadow Archiver (in shadow.[arc?|lzh?|zoo?] on atari.archive.umich.edu in ~/Archivers) creates .MSA files, which are often compressed using a normal archiver, such as zoo or lharc.

Magic Shadow is notoriously bad when used on a 1/2 meg ST and only one floppy drive. Its disk access and memory use are very badly thought out, and could result in over 160 disk swaps when unpacking an 80 track, double-sided disk.

Due to the fact that it was the _only_ disk image archiver around for quite a long time, Magic Shadow is the de-facto standard for creating disk images of computer demos and other pieces of software that cannot be easily compressed as files.

Because MSA files are disk images, they can only be used to recreate a floppy disk. There is (currently, see below) no way to extract the files from an MSA archive without writing it to a floppy disk.

Magic Shadow works perfectly with any legal TOS floppy format, even high density disks found in modified STs and most MegaSTes and TTs.

Chris Herborth (herborth@pinot.waterloo.ncr.com at work,
cherborth@semprini.tdkcs.waterloo.on.ca at home,
C.HERBORTH on GEnie) is writing a much more efficient MSA extractor, called UnMSA. UnMSA will minimize the number of disk swaps, and speed decompression considerably.

Daryl Richards (no email address, yet) is working on an MSA-Mounter, which will allow someone to unpack an MSA archive to RAM or a file on a hard disk. This uncompressed disk image will then be added to the system as a logical drive (much the same way a RAMdisk adds a drive to the system). MountImage on the Mac is an example of the way MSA-Mounter will eventually work (MountImage is so good, you can install new versions of the Mac OS using floppy disk images stored on your hard drive).

There is yet another MSA archiver now, called MSA II, by Phillip Lang.

:CLI: ??.??.??
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3

```
CRC error.....................-4
Bad request...................-5
Seek error....................-6
Unknown media.................-7
Sector not found..............-8
No paper......................-9

General error................-12
Write protect................-13
Media change................-14
Unknown device..............-15
Bad sectors on format.......-16
Insert other disk............-17
Invalid function number.....-32.....1
File not found..............-33.....2
Path not found..............-34.....3
No handles left.............-35.....4
Access denied...............-36.....5
Invalid handle..............-37.....6
Insufficient memory.........-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46....15

No more files...............-49....18
Range error.................-64....33
Internal error..............-65....34
Invalid program load format....-66....35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

:GDOS: 93.05.05
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called SpeedoGDOS, which should be available commercially from Atari. It is currently included with AtariWorks, and some Falcon packages. SpeedoGDOS uses scaleable fonts - you do not need to create a font file for every point size. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within SpeedoGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

In the UK The ST Club (2 Broadway, Nottingham, UK NG1 1PS. Tel 0602 410241, Fax 0602 241515) is a licensed GDOS distrubutor:

Catalogue No's:
GDOS-A Driver + Fonts 9-pin
GDOS-B Driver + Fonts 24-pin
GDOS-C Installed system for Opus (9 pin)
GDOS-D Opus 24-pin
GDOS-E FontGDOS + drivers
GDOS-F 300dpi printer fonts

Disks 2.95 pounds each.

:GNU: 93.06.11
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.4.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.4.2 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System

SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM: ??.??.??
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG

Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG: 93.10.18
Public Domain/Shareware languages...
==========
(This section is getting an overhaul, but I don't have the time to finish
the overhaul right now... Sorry, check back next month.)

There are a large number of programming languages available for use with the
Atari ST. Programmers seem to flock to the Atari ST, and if you know of a
language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassemblers: a68, turboass,
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)

Elan
FORTRAN
FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME
SIOD
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX: ??.??.??
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to

upload and use them for evaluation purposes. The READ_ME file tells how
MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN
TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix
newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT: ??.??.??
What is MiNT?
=============
MiNT is a free multitasking operating system extension for TOS. It is somewhat
like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM
program along with a lot of character-based programs simultaneously. MGR
and MW2 can both put multiple terminal windows on screen, and bgacc can
put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go
with it can be found at atari.archive.umich.edu:/atari/mint.

TOSWIN is the new replacement for bgacc: it provides lots of nice features like
variable fonts, menus, selectable window gadgets, etc. GEMTERM is a similar
package (it's not part of the standard MiNT distribution) modelled after TOSWIN
and XTerm.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking
OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now
'MiNT is Now TOS'. :-)

:XWIN: 93.03.01
Is there a version of XWindows for the ST?
==

There actually is a port of XWindows to the ST now, although it is pricey.
Here's the (slightly hacked up) announcement for it:

X/TOS/window/server and X/TOS/window/server/color

Vendor:
X/software Michael Gehret
X/TOS division
Marktstrasse 8
W-8944 Groenenbach
Germany
TEL: +49 8334 1411
FAX: +49 8334 6245
email: xtosinfo@xsoft.uucp
CPU:
Atari Mega ST, STE, TT
68000 to 68040
Memory:

2 Mbytes (4 Mbytes recommended)
Operating System:
TOS 1.4 or higher
Mouse:
Atari mouse
Graphics:
X/TOS/window/server:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
X/TOS/window/server/color:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
color 320x200x4
color 640x200x2
color 640x480x4
color 320x480x8
Ethernet Card:
Atari Card (Mega or VME bus)
Riebl/Wacker (Mega or VME bus)
Biodata BioNet 100 II (DMA port or VME bus)
Network Software:
Atari/Riebl/Wacker ANS TCP/IP
Biodata TCP/IP
Disk Space:
none (two floppy disks, may load fonts from second disk or font server)
Features:
full X11 Release 5 implementation
Shape, Multi-Buffering, MIT-SUNDRY-NONSTANDARD extensions
PEX extension optional
support of font server protocol
support of X Display Manager Protocol
access control support
compatible to OSF/Motif and OpenLook
high performance (more than 32,000 Xstones on TT)
fast cursor tracking
backing store and save unders support
size of virtual screen limited by memory only, automatic panning
X/TOS/window/server/color supports all video modes at the same time,
including dynamic visuals
loadable key maps (xmodmap format), full support for European keyboard
layouts
3-button mouse emulation with Atari 2-button mouse
may run parallel to GEM (switching with hot key), configurable multi
tasking priorities
about 50 fonts supplied

:DEMOS: ??.??.??
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from atari.archive to allow this.

:PAINT: ??.??.??
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett. The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD: 93.06.11
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ZIP, .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@spud.hyperion.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu, jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP: 93.05.05
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
----

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu in /computing/systems/
atari/umich.

:TEX: ??.??.??
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0. This consists of 8 disks full of TeX stuff, plus an installation program that takes care of the details for you.

==========

Hope you liked the comp.sys.atari.st FAQ. If you have comments, suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for compiling most of this FAQ.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
TT, and Falcon. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:
```

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:MODELS: 93.01.30
All the models in the ST line
==========

This is a pretty complete list of all the ST/TT models and their main features. If you have any additions/correction, of course, send them to me.

Feature key:
CPU's:
8 8 MHz 68000
16 16 MHz 68000
16/3 16 MHz 68030
32/3 32 MHz 68030

RAM:
/1 128kB
/5 512kB
1 1MB
2 2MB
4 4MB
S SIMM slots for expansion

Built-in:
F Floppy
M TV modulator

Extra:
AV 8 bit digital stereo audio, 4096 colors, hardware scrolling, analog joystick ports
MB MegaBus processor-direct bus slots
6U 6U VME bus slots, second serial port
FC Motorola 56000 DSP, 16 bit stereo audio, much enhanced video

TOS:
Highest built-in TOS

Models:
Name CPU RAM TOS B.I. Extra Comment
---
130 ST 8 /1 1.0 M Never marketed
260 ST 8 /5 1.0 M

:FALCON: ??.??.??
What are the specs on the Falcon?
==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

:ACCEL: ??.??.??
Hardware Accelerators
=====================
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM slot
68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:TAPE: 93.08.11
Can I use a SCSI tape drive?
============================

Yes, just about any SCSI tape drive should be useable on the ST line. (Of
course, if your computer doesn't already have a SCSI port, you'll need a SCSI
host adapter.) There are at least two freeware/shareware programs that can
help you back up your HD to SCSI tape: TapeBIOS and GEMAR (a German GEM
ARchiver)

:DRIVES: ??.??.??
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:

```
-------------- ----------- ------------ ----------
| MFM drive |------->|ACB 4000 |------>| ICD |------>| ST DMA |
-------------- ----------- ------------ ----------
```

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put
the drive internally, you will need a case with power supply to house the
adapter and hard drive. IBM case is very easy to get and has a lot of space
for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive
they use about 20 watts or less, Quantum LPS drive use about 10 watts each,
make sure your power supply has more than the drives need. Again if you
use IBM case, the 150 watts power supply for that type case can drive at
least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL),
it's 50pins IDC female connector on each end with 50 conductors
cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be
available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again.
And check the jumper setting on the drive (consult the drive's manual). If you
are using more than one drive with the system, make sure only the last drive
has the terminator (either a DIP or a signle inline package of resistor, which
usually is socketed and close to the SCSI connector on the drive circle board.
Remove the terminator from other drives. [only the last drive should have the
terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5
from ftp sites.

:FLOPPY: 93.08.11
Can I use 1.44 meg floppy disks and Flopticals?
==========

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe
and TT machines. If you own an older Atari ST, there is a company which offers
a $199 kit (including floppy) to install and use the drive.

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the
desktop.

Floptical drives (floppys that use optical tracking to get 21MB on a 3.5" disk)
can also be used through a SCSI port. ICD's newer host adapter software (the
'PRO' version) will handle them.

:GRAPHIC: ??.??.??
How can I enjoy enhanced graphics on my ST?
==========

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by Ben Gilbert
and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync
monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Here's a few more cards, available from OverScan GbR, Saentisstrasse 166,
1000 Berlin 48, West Germany, ++49 30 721 94 66, ++49 30 721 56 92 (FAX),
++49 30 727 05 6 (Mailbox, language: German)

Autoswitch OverScan for the ST (NO STE compatibility) is DM 129.--, you
don't have to buy a new monitor. The maximum resolution on a SM 124
is variable, but in most cases at about 732*480.
AutoSwitch OverScan TT is a VME board. It's about 249.-- DM, you also can use
your old monitor, but it only works in the TTs five color modes
(3 ST-compatible modes, 2 TT-modes). Resolutions are variable, ask
OverScan about the values for your monitor.
Falcon ScreenBlaster blows up your Falcons resolution to a maximum of nearly
900*600 on SVGA-monitors. It'll be shipping as soon as Falcon030s

become available, and the pricing will be near 150.-- DM.

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:KEY: 93.09.02
A few keyboard questions
========================

Here's how to connect a MegaST-keyboard to a 1040ST:
It's taken from the "ST-Computer" October '90 ('Quick-Tips')

****
And here's another one: This one's about the Hardcopy-function of the ST's
****

Do you hate it - after pressing <Alternate>+<Help> the same time - when
you don't have a printer connected to the parallel port of your ST and
must wait a long time to work again because of the long break taking the
computer to realize that there's no printer connected?
Well, do this and forget about it:

connect the following pins of the printer port of your computer (better:
create a Sub-D 25pin-male-plug an connect the pins on the soldering side):

pin 13 connected to 14 and 15 (all across the plug)
pin 1 connected to 10
pin 23 connected to 11 and 12

****

:JOY: ??.??.??
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style
joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of
time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable
units"

:MODEM: ??.??.??
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOW to you!

You will probably need a serial port patch program to use high speed modems on your ST; most versions of TOS have a bug in CTS/RTS handling.

:MONITOR: ??.??.??
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM: ??.??.??
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE: ??.??.??
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases. The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and

the excessive use of disk accesses in Mac software will have you wanting
a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File
Exchange if you are needing MS-DOS data disks for Mac work. Language
configuration support, keyboard support, A4 paper size support for
Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a
MacIntosh with a decent screen is indescribable. The extra flexibility
that you get will also make you feel more confident in the greatness of
your Atari. You will also get to see some of the frustrations with one
of the other sides of the fence - frustrations like excessive disk access,
remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating
philosophies of an ST and of a MacIntosh. You really must read the
documentation that comes with the Spectre GCR (and I for one found that
a real delight. Dave and Sandy have a very different approach to software
documentation that makes it enjoyable reading.) You should also read the
Mac Operating System docs. One other reference you may need if you are
going to do much with Mac software is one of the reference manuals
referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on
a GCR, don't figure you will get a straight answer. They won't know.
The current compatibility list from Gadgets lists about 450 programs
and their release numbers that have been tried and found to work with
Spectre GCR. In general, if a piece of software won't work with the GCR,
it is probably becuase of copy protection. Most serious Mac software is
not copy protected.

One last note - earlier versions of the emulator exist that were not capable
of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from
Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64
KB ROM which is not good) to fully utilize the device. Also it's recommanded
to use it with MONO monitor and at least 2MB RAM. The Spectre software takes
about 300 some KB of memory, so on a 1040 there is not very much left for Mac,
especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most
Mac drive is double side). With DOS mounter or software like that you can read
/write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM
binary. It's only for file transfer). Or you can use Apple File Exchange to
read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not
run with it.

:UPGRADE: ??.??.??
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments, suggestions, more material, etc., mail me at sourada@iastate.edu

115. LOSE MONEY SUPER FAST!

Newsgroup: comp.sys.atari.st
Date: 1994-04-03 03:35:46 UTC
From: Wes Simonds <ginsu@ccwf.cc.utexas.edu>
Message-ID: <2nldii$3qh@geraldo.cc.utexas.edu>
Source record: 189987
Cross-posted to: alt.games.doom,comp.sys.ibm.pc.games.misc,comp.sys.amiga.games,comp.sys.atari.st,misc.arts.anime,rec.arts.startrek.misc,rec.games.chess,rec.games.video.nintendo,rec.games.video.sega,comp.sys.mac.games

Hi. My name is Wes Simonds. I'd like to tell you a little bit about myself. Just two short years ago, I was doing perfectly well financially. Not too great, not too shabby: breaking even, maybe making a little bit after taxes. The creditors were failing to break down my door, which was only fair, because I was failing to break down theirs (I gave up Door Breaking several years ago for Lent and have never been tempted since). The phone was ringing off the hook, but that was because the bell was broken and the phone was on a slight incline, so that any slight disturbance could tip it over. All in all, life was good.

But one thing was wrong: I still wasn't a billionaire. And I don't have to tell you what THAT'S like. Frankly I went through three separate existential crises coming to grips with the unfortunate truth of the matter.

Then one fateful night I got a fantastic letter in the mail. It outlined a magical plan by which I could make HUGE amounts of money through the mail. All it involved was a few minutes of my time, a few stamps, and a little faith!

Well, needless to say, I was a little skeptical. After all, I'd heard of these get-rich-quick schemes before. I knew they were really rip-offs. I knew this because I had participated in every single one of them.

But the more I looked over THIS magical plan, the more convinced I became that it was NOT like the others. It was unique and special, and best of all, it was completely legal!

Now I would like to offer you too the opportunity of participating in this magical plan. You too can, with only a few minutes of your time, a few stamps, and a little faith, help to make me rich! Even richer than Bill Gates!!!

Here's the way it works:

First, make five copies of this letter. Write down a list of five of your friends. Send each of them a copy of this letter. Then, send $5 (that's five dollars) to me, Wes Simonds, and nobody else. Mail out the copies of the letter, making sure that each copy makes it clear that the same instructions should be followed. Each one of your friends should then send only $5 to ME, Wes Simonds, and then mail out five more copies. And so on.

When I get the money, I will keep all of it.

And in return for your contributions, I will cheerfully mail all of you a xerox of my bank balance, both BEFORE and AFTER your check, cash, or money order, showing you EXACTLY how your money was allocated!

As I said before, this is TOTALLY and COMPLETELY LEGAL!!! Under federal law, it counts as a simple gift. There is no risk, and no possible repercussions can follow!

However, this will ONLY WORK IF YOU FOLLOW THE PLAN EXACTLY. Failure to do so will result in my not becoming rich.

Here is the testimony of a few people who have followed this simple plan and become very slightly poorer as a result:

"I got the letter and thought, what the hell, I'll send Wes the money. It's only five bucks -- sometimes I spend that much on a date! And then -- I got the xerox in the mail! It really works. Wes is slightly richer because of me!!!"

-- Dan Nolen

"Want to know how I feel? S-K-E-P-T-I-C-A-L. But hey, five bucks, what's that??? Here goes nothing! Waiting for my xerox!!"

-- Leon Lee

"Well, here goes. I am now the 201st person to send Wes the money. Hoping things pan out!!! Don't make me the last person on the chain -- I WANT my XEROX!!!"

-- Stacy Cooper

The address to which all money should be forwarded is:

Wes Simonds
3543 Greystone
Austin, TX 78731

And remember! THIS PLAN WILL NOT WORK UNLESS YOU CONTRIBUTE!!!!

```
M A S T E R B R O W S E S U R V E Y
-----------------------------------

Hello,

Since MasterBrowse was first released, one year ago, it has grown in
many ways. Unfortunately, one of the ways it has grown is in size. I
am writing this survey in an attempt to determine if MasterBrowse has
become too large, and what should be done about the problem if it has.

To take the survey, simply answer ALL of the questions below, and
send the reply to:

mforget@elfhaven.ersys.edmonton.ab.ca

-------------------------------------------------------------------------------

1. Do you feel that MasterBrowse is too large? It currently uses 150K
of disk space, and 315K of memory. (This is for the unoptimized
version, though. The optimized version is 26K smaller.)

2. If MasterBrowse is too large in your opinion, which features should
be removed?

3. What features would you like to see MasterBrowse have? (For
example, the next version of MasterBrowse, currently under testing,
has full Unix regular expression matching, rounded radio buttons,
and real checkboxes with crosses.)

That is all there is to it! (Short survey, huh? If you have any kind
of opinion about MasterBrowse, let me know what you think!)

[> M-TOS is essentially for! :)

Minix and the Minix FileSystem are not the same thing. With MultiTOS,
you can use the Minix FileSystem. It will give you all kinds of new
features, and is much faster that the TOS FileSystem. You can, of
course, put anything you want on the Minix FileSystem partitions you
create.

Minix itself, though (not the file system) is a different operating
system. Unix, but smaller...? I've never used it, but I do know that
it will not run GEM/TOS applications.

Hi Stuart,

I cannot resist; sorry. :)

The RDD is not the only option; there is MasterBrowse. MasterBrowse is a very fast 100% GEM text file viewer, that works very well with Geneva, MultiTOS, and Mag!X. MasterBrowse has very advanced printing capabilities (double-sided printing, printer control codes, page numbers, line numbers, page descriptions, and synopsys) and has extremely powerful searching. The new version of MasterBrowse has support for Unix regular expressions (wildcards). MasterBrowse is available at atari.archive.umich.edu in the /Newitems directory as mb36_bin.lzh.

The new version (with the regular expressions and more) should be available in a few weeks.

(NOTE: This is not to knock RDD; it is a very fine program. Since I am the author of MasterBrowse, I _have_ to say how much better it is. I am sure that Stuart feels the same way about his program. Competition is competition, though...:))

>
>or I have to change it for a PC Double Sided drive ?

Should work allright. I have replaced a 720 with a 1.44 without any
problems, however,
1 It will only work as a 720
2 Make sure the data cable is connected correctly. Some drives
require the cable being turned through 180 degrees.
3 The drive is probably set up for IBM thus may require the setting
changed. The drive I installed had a small slide switch on right
hand side near the back of the drive. By your description of the
drive just spinning it would seem that this setting needs change.
1 to 0 I think was the change though my memory on this is dim.
Good luck
Peter

Get hold of a system analyser program like Profile or Sysinfo and it will
tell you. Also, the control panel (xcontrol).

The current version is 3.0zm (12.02.94), which now works with WiNX 2.2 and
the MagiX 2.0 OS.

You will find it on a.a in (I think) Programming. I got it from there
just a weeks ago.

>Second: I'm not very fluent at writing perl-scripts yet, so it's quite a
>tedious task to check if this mperl is really good or not. Anyone any
>experiences with it? Better suggestions?
It works very well - and I haven't needed Mtos yet. Very solid. The only
problem ssems to be that the stderr is somehow connected to AUXout.
This can be an advantage or disadvantage. I find it an advantage, because I
have a Mega ST$ connected by RS-232 to my Falcon. I have even modified
perldb.pl slightly, so that I now do all my debugging by running Rufus on the
Mega, while working with normal program output on my falcon.

>the bootconf program. Anyone know what the FFC button does?
I reviewed BlowUp Hard for the March issue of Moj Mikro. The version of
software I got was 1.7 It allows FFC and it allows you to instantenously
switch resolutions provided that you have the same dimensions.
Thus you can have 1200 x 960 virtual (actual 640 x 480) and 1200 x 960 actual,
and then switch between them without reseting. Nifty.

If FFC is selected, (FFC= Flicker free compatibility), than your compatibility
resolutions (ST LOW, MED, HI) and resolutions without any settings will be
displayed at 72 Hz. Also quite usefull, especialy if you have programs
which only run in st high.

I copied the letter and E-mailed it back to him (with a "don't do this
again" letter at the top...).

btw, if this scheme were to actually work, the 'Net newsgroups and E-mail
would flood. I think this would equal a virus that infects both internet
computers and the minds of the stupid people that would actually fall for
the scheme. Fraud & Virus spreading.... to VERY illegal activities. :)

My suggestion is do what someone else here mentioned before, copy the
letter and E-mail it to him. Any decent System operator would delete a
user's account after it starts eating storage space...

Message-ID: <2nn42p$9fm@scratchy.reed.edu>
Source record: 189810

I recently purchased a Quantum LP52S new and much to my chagrin I realized that it is incompatible with the way SCSI is implemented on the Amiga. The drive works and I have formatted it on a Mac. My problem is that I can't use it but I can't return it either since it works. I can't sell it to Mac or IBM users since they typically use >250 meg drives. The drive is brand new and I is worth well over $100. I haven't used the drive at all except to test it, so I hope to get most of my money back. Thank's for helping out and the drive will go to the best offer. I am hoping to sell it for $80-$100.

Thank you.

If you send an International Money Order it costs a little more but you
can at least see if it has been cashed.
Typical scenario:
Anxious: "Where is my book, 'The Joy of Windows'?"
Dodgy: "I haven't received your order."
Anxious then checks with post office and a few days later finds that IMO
has been processed weeks ago.
Anxious: "You are a low form of something from the family Prick."
Dodgy: "So sue me. If you ever make it over my side of the world I will
use the money you sent me to have someone kick your butt."

You may as well send money.
'The Joy of Windows' is available wherever good stupid book titles are sold.

: >If the emulator gives access to the standard falcon SCSI port, no doubt
: >it will! Basically it's the Falcon equivalent of the ST's ASCI port,
: >and I know of no PC emulator which didn't support that!

: Yes - but at what level? Surely for a PC CD-ROM system to work, the PC CD-ROM
: driver has to think there is a PC SCSI host adaptor in the system (eg Adaptec,
: Future Domain etc).

Actually this isn't totally accurate. There are several different types of
CDROM support on a PC. First. Accessing the date on the CDROM. This would
be the most basic support. For doing this the Atari would basically need to
access the CDROM as a drive. The emulator would need to then support emulation of the drive
from the ST driver. (I don't have and ST anymore I have a PC. I
don't know what kind of support the ST provides for accessing CDROMs.
Presumably your SCSI drivers from Atari or a 3rd party support SCSI attached
CDROMS) After being able to access the CDROM as a basic drive, you have to
worry about the mscdex (MicroSoft CDROM EXtensions) driver. This driver isn't
required by all cdrom applications. Some applications use the CDROM as a disk.
On the net there are some drivers that fake the mscdex driver on PCs to support
CDROM drives that are being accessed on PCs from across networks. If the
Atari PC emulator is halfway reasonable this should work. This will enable
the PC emulator to run ANY cdrom application. The next problem will be sound
support. Most sound support on the PC requires a sound blaster sound card. If
the emulator emulates this card as well, you should be able to run just about
any PC multimedia software. The last capability would be to play CDROM based
music that is directly recorded on the CDROM. I don't know what would be
required to do this. I do know that most software isn't using this capability.

If you have questions or want to know more send me email. I don't regularly
frequent this group only when I'm remenising...

: AFAIK ST PC emulators don't work down to this level. All they do is present
: a (PC) BIOS frontend to the SCSI port - allowing higher levels (eg DOS)
: to access the Atari's hard drives as if they were suported by the PCs BIOS.

Correct. The question is whether the Atari drivers to support CDROM are
transparent to the emulated PC Bios. IE from the PC BIOS does the CDROM drive
appear to be another hard drive.

You would not be able to take a PC SCSI driver and run it in the PC emulator
and expect it to work since the driver would be hardware specific.

: As a CD-ROM is *not* supported by the PC BIOS as standard - I don't see
: how it is going to work.

Remember also that SCSI drives aren't supported in the PC BIOS. This is where there is hope that this would work. The emulator has to translate PC BIOS calls into ST calls. If the ST BIOS supports calls to access the CDROM as another hard disk drive than, I'm virtually certain the emulator would be able to access the CDROM as described above.

143. Re: Mega keyboard

Newsgroup: comp.sys.atari.st
Date: 1994-04-03 21:58:52 UTC
From: ktessner@isle.waterloo-rdp.on.ca
Message-ID: <1994Apr3.215852.2496@isle.waterloo-rdp.on.ca>
Source record: 189819

Scott E. Parker was heard to mutter:

> 1. Is the Mega keyboard a "decent" keyboard (solid key contact, good
> tactile feedback)?

My friend always hides his Mega keyboard when I go over to his place. He knows it won't stick around too long if its left out ;-) In my tastes, it is the best keyboard I have ever used. I get no finger strain from it, and my fastest typing speeds to date have been on Mega keyboard. If you can get a hold of one, go for it!

> 2. What should I expect to pay for one?
> 3. Where's the best place to get one?

I wish I could answer this, but other than recommending that you steal my friends, there's not a lot I can say.

Yes, But what is now the staus of it?
Trash-Can ware?
May it be resold (once, without keeping another copy!)
as any other sw-package one has bought ?

Is it in the PD?

>It never became very
>popular unfortunately, so it was never upgraded. Digital Research, who wrote
>the language did some weird things with the file selector, and that is where
>things went wrong when I installed TOS 1.4.
The 'weird thing' was, that te program grabbed all the memory it could
get. It over left nothing! So even the OS could no longer open a fileselector box.

> I didn't have any time yet to check
>for a possible fix.
Some (long) time ago a fix for the mentioned problem was publishe in a
jounal.

Sorry, I assumed (incorrectly) that everyone is familiar with
Quantum model numbers. The LPS series are low profile drives 3.5" radius
and 1/3 height. It is a very fast and reliable drive that comes with a
two year warranty. Although it is only 52 megabytes, it is a great drive
for daisy chaining (which was its intended use). The drive has jumpers
that can set the SCSI ID from 0-6 as well as a jumper for parity checking.
It has a list price of $170 and usually sells for $130. I realize that I
will probably take a loss on this drive but it is useless to me so I must
get rid of it.

Not necessary. Simply mail the message back to the source. You'll have
to type in the source's address, but that should be on the screen (and if
you are on a dial-in line with an intelligent terminal program, you might
be able to lift it off the screen and send it back.)

It was none other than Chris Wood that wrote on 29 Mar 94 that ,

CW> To make it truely appealing, I would suggest that the GUI be
CW> changed more in line with other GUI's, have either UNIX or
CW> TOS style filesystems, with support for Minix and TOS disks,
CW> even if it's just for reading. Support for TT and Falcon 256
CW> and above colour modes will also be essential. With this I
CW> would consider it and excellent buy.

With complete non compatibility with TOS It's going to have to be pretty
amazing to be of any major interest to more than enthusiast's.

Of more interest IMHO is OMEn although I am basing what I know of it on
Magazine articles . The jist of which list it as A cross platform pre-emptive
Operating system with native code capable of running on any 68k based machine
(Atari ,amiga or Apple etc).

CW> BTW It's 135 quid, I believe, and more intersting than OS/9.

OMEn will be distributed Shareware with developer's kit and Doc's .

This I am interested in .. anyone seen anything of it ? Or even have it ?
being released by a company called Esquimalt Digital Logic (Canada).

[> Marcos Vera Yanez
[> mvera@inf.utfsm.cl

Hi,

I am the author of ESS-Code, a program that will encode and decode files
in the format you ask about. I am not sure what you want explained,
though; how to use it? (See below.)

If you have FTP access, get ESS-Code 5.06 at atari.archive.umich.edu
in the /Newitems directory, as esscd506.lzh. It is a GEM application,
so all you need to do is extract it and double click on ESSCODE.PRG.
As soon as you are in the program, press the HELP key. The entire
process of UUEncode/UUDecode will be explained to you, as well as how
to use the program.

Does this help at all? ESS-Code also does other conversions, like BTOA.
It is very easy to use. If you have any problems, send me a message and
I'll try to help you out with it.

>look at it, but have found a major stumbling block, it is is a
>1.5 meg *.tar file. What the heck do I do with that??

find a copy of Tar, and untar it. It's probably been compressed
after being tared, so you'll need to decompress it first, then
detar it.
Compress only compresses one file, so tar is used to put several files
into one before being compressed.

>Also, if anyone knows where version 1.10 is, or where UUCP point
>is located(as well as the current version), that would be great.

If you have no luck, try contacting it's author, and if that fails,
email me your postal address and i'll send you a few discs.

The author is....

: Why don't we get all the netters to mailbomb this guy with 5000 line email
: messages?...five times a day...

Because he will not be the only person to suffer. All incoming mail is
held in a spool directory until it is handled by the system mail
manager. Fill the spool and nobody on the system gets mail until the
spool clears.

Best thing to do is send a single copy to the postmaster at the poster's
site and let him handle it.

Was there someone around here looking for a SC1224? I've got one extra,
willing to sell it, email me.

Dave> so I must get rid of it.

In case anyone was wondering, I use a Quantum LP52S in my MegaSTE with
the Atari host and it works wonderfully. VERY fast! I also used it
with my ICD Advantage host along with an old Seagate so it's got a
good SCSI implementation.

I also bought mine for $40. Used is used, man...

je>Another thing with Teradesk that i cant get to work is the viewer
je>program that was included in the Teradesk 1.38 packet.

Neither can I (3 bombs), but you can use the 1stguide/1stview acc
instead. This will leave you with double functionallity
(tekst-viewing), but it also views img and 1stwordplus docs, and
integrates nicely in teradesk (same as in gemini). If you have enough
ram, and are willing to register, gemview (acc) views about
everything there is to view.

je>And BTW,does the author Wout Klaren got an E-mail address..??
je>I have an idea that i want to tell him..

Don't know, he lives in Holland, and he leaves updates on a bbs near
me, but no e-mail address. Try snail-mail.

Hello to all;
The only bitmap bros. game i have is The Chaos Engine. It is an
excellent game. It worked fine on my ST. But i have since moved to a
FALCON and all i can do now with it is stare at the disks. It does not
run on the FALCON at all.
Does any one know if they are planning a FALCON version?
I wrote to them a while back but received no responce to this date.

From: charrier@int-evry.fr
Message-ID: <2nplau$ddf@reseau.cict.fr>
Source record: 189847

I have two stupid questions I couldn't answer by myself :

- From what site can you get the GNU C linker (gcc-lb.ttp) ? It does NOT come with the gcc258b.zoo archive on atari.archive, and I wasn't able to find it on ftp.uni-paderborn.de, ftp.cs.ruu.nl etc. This is rather annoying since it's the only thing I need now to use gcc...

- How do you configure gulam so that you can use it properly with a French keyboard ? Finding a symbol by trying all keys is rather boring...

OK, I know everybody knows the answers, I shouldn't have posted this, I am wasting bandwidth etc. but I REALLY couldn't find the answers so please help me ! Thanks in advance.

174. Help needed!!!

Newsgroup: comp.sys.atari.st
Date: 1994-04-04 19:14:58 UTC
From: robsch@Ingres.COM
Message-ID: <1994Apr4.191458.26406@pony.Ingres.COM>
Source record: 189849

Hi All,

I just bought Majic Arcade Graphics Engine(MAGE) last week. I seem to be having a problem getting things going. I have called tech support and Larry gave me something to try. I was wondering if anyone else has run into problems with MAGE? Is anyone else out their using it?

Here is my setup:
1040stf - 1 meg, version 1.4 TOS
ICD host adapter running version 5.6.0.
Quantum LP52S harddrive
TimeKeeper clock
QuickST - (unknown version)
USIII - last version

Here is the story:
I ran the install program(which Larry said just does a direct copy) and tried to run and of the prg's (MS_CHAR etc). All I would get is 4 bombs and back to the desktop.

I then ran the programs directly off of the disk. The MS_CHAR program ran fine. I thought maybe and install problem. I hand copied all of the disks to the HD. Ran MS_CHAR and all was fine. I then tried to save what I had done as a sprite file. The fileselector appeared. I type in the name of my file and selected OK. The program prompted me to insert disk B into drive A. I had no idea what was going on. In the file selector I told it to save the program to my HD. According to Larry this dialog box does not appear in MAGE. Another thing the Once the dialog box appears the only option os OK and the mouse is gone. Thats right no mouse appears one the screen. I pressed return and the disk drive light came on for a second or two and then the HD kicked on and save the file. I check the DD and nothing new appeared there. I checked the HD and my file was there.

I was able to load the file into the sprite editor(MS_CHAR) just fine. But everytime I save it seems like this dialog box appears without the mouse.

Next I tired going into the GFA menu shell and loading one of the sample programs. I tried running this through the interpeter and the screen went white and the machine locked up. I was not even able to reset the computer via the keyboard. I turned it off and back on. Several tries at running this program from the interpeter yielded the same results. I then decided to compile and link the program and see what happens. It compilied and link fine. I then ran the program and it ran fine. I then pressed ESC to exit and I received 2 bombs and was

thow back to the desktop.

I decided to try and boot up with a clean system. At know time could I get rid of all of the mentioned problems. I unsure what happened when. I'm going to give this another try. I was just wondering if anyone else has any insight into this. All suggestions appreciated.

I'm not writing this software off yet. This seems like a pretty comprehensive system. Larry told me to call back if I still have problems and he will give me Dave Munsie's phone number. He is the creator of MAGE.

This may be a problem with my hardware, but I have never had anything else go wrong with it. This seems to be the only software I have that acts funny.

Thanks in advance
BobS

175. Deskjet 500C & 550/560 compatibility

Newsgroup: comp.sys.atari.st
Date: 1994-04-04 19:21:16 UTC

From: azog@world.std.com
Message-ID: <Cnr4tu.1pp@world.std.com>
Source record: 189755

Last week, there was some discussion about the policy of source-only distriution of MiNT on the net, and some people who were no quite sure, or were unwilling to tackle the job... I recently posted a problem about compiling the new 1.09, but it turns out it was someone of my own idiotic doing that was causing problems...

Anyways, its pretty easy, but assumes a lot. If anyone is interested, I can post the steps that *I* took to compile 1.08. (I streess the I here, because things are not always the same). I successfully compiled the 030-only version of 1.08, and have it running no problem. Took about an hour. (not including the time to gather needed files, which I had done ages ago, when I was running an STe). Everything needed is readily available on the net (atari.archive.umich.edu to be specific, or any of its mirrors).

181. Falcon Minixfs problems ...

Newsgroup: comp.sys.atari.st
Date: 1994-04-04 21:04:26 UTC
From: shenson@nyx10.cs.du.edu
Message-ID: <1994Apr4.210426.645@mnemosyne.cs.du.edu>
Source record: 189756

As some of you may know Minixfs pl9 has problems with some Falcons. I don't know why and (not having a Falcon myself) can't easily find out. So basically I would like anyone who has seen this bug to email me if you are prepared to recompile Minixfs in the hope that this can be fixed. Since pl10 is otherwise waiting (it hasn't changed too much from pl9) I hope to resolve this problem as quickly as possible.
The bug appears to be a 'crash' (I haven't got any further info about what kind). It is probably Falcons only. It also appears to be related to MultiTOS AES (I have had a report that the problem goes away when the ROM AES is used). From some net info it may also be related to whether you use IDE or SCSI ports. The update daemon appears to be triggering the problem (the one consistent thing is that killing update or using non-Turbo mode cures the problem).
So anyone who can recompile Minixfs and has seen this bug please contact me, giving a rundown of your setup (see the bugs.doc file for the info I need). Please note you should use a later MiNT that 1.04. 1.04 has some bugs of its own that make Minixfs unstable.
I have a patch or two that alters the way the update daemon works (and if MiNT 1.11 is released with certain syscalls then it will be removed altogether) which may help (I've had no feedback yet though).
If I find something that works, or I'm convinced that only a MiNT or MultiTOS fix will help then pl10 will be released shortly after.

Thanks in advance, Steve.

: all the files from the nic.switch.ch mirror of the umich archive. Any
: ideas? Has anyone succeeded in getting this kind of setup to work? Or,
: can anyone suggest a way to edit the BJ10 driver to change the page size?

I'm using the FontGDOS driver with the old version of GDOS, and it works beautifully. I haven't had any problems with page size. AFAIK, the maximum area the BJ200 can print is 8 by a little over 10 inches. It certainly won't print across all 8.5 inches, and I know the it won't print across about a quarter of an inch at the top, and a bit more at the bottom of the sheet.

There are pretty few Falcon-only games out yet, but here are some of the better ones:

- Ishar 1/2/3 (Silmarils)
- Robinson's Requiem (Silmarils)
- Transarctica (Silma]Nrils)
- Llamazap (Jeff Minter!)
- Humans (Atari?)
- Golden Island
- Stone Age

AND NOW... If SOMEONE working for MICROPROSE reads this, or has a chance to give this message forward... :

!!! Please, make a FALCON-030 UPDATE / UPGRADE for the FORMULA ONE G.P game ..!!! That game has sold over 50.000 copies for Atari ST only - which should , howevprove its success? That damned great game is, however, NOT Falcon -compatible, and does definitely NOT utilize hard disk drives, faster CPU:s, or almost anything. Since F-030 is perfectly able to use exactly the same 256 color VGA -graphics as the PC-version, and the machine has lots more horsepower, it should be rather easy to make the conversion.
I personally think that it would be VERY kind, and even economically viable to support us ex. ST-, today Falcon-owners by MicroProse, and others. The fact is this: if over 50.000 ST-owners really bought the game - then VERY many Falcon owners would dKefinitely want to buy one too!

If there are more Atari/Falcon users who agree - please, act. Falcon really needs - and deserves - a GOOD racing game, so MICROPROSE - why not give us one..? Because F 1 GP is the best. We will buy it, if F1GP for Falcon will be reality.

I use Hard Disk Sentry, from (oh, blast, what's his name? You know, the guy
that wrote the Multi-tasking C Shell. Last name start with a "B"...).

It works on my 40+ meg partitions on my TT. I swear by it; it was able to
repair a damaged partition on my ST's drive that chkdisk3 said was OK, but
obviously wasn't!

It should be available from your dealer (assuming you have one), otherwise
by mail order.

Oh, you clever boy...

Why not do something useful and mail it with a complaint to the system
admin at that site (root or postmaster).

Mail bombing the individual responsible is patently stupid advice,
especially when the user's account is likely to have been terminated
already, causing your mail to bounce (D'oh!).

I'm looking to get a CD-ROM drive for a 1040 STe, and already have a Supra SCSI host adaptor. I found an old external SCSI drive made by Reference Technologies circa 1986. Will this function with the supra board, and will it read the GEMini Atari CD-ROM disk? This is the only function I have for the drive at the moment.
Thanks,

mbmccabe@bronze.coil.com (Matt McCabe) writes:

>P.P.S. What has Minix to do with the speed of MultiTOS

MultiTOS allows new filesystems to be loaded.

TOS is a slow filesystem (unavoidably so, since it is DOS-compatible).

Minix is a fast file system (since it follows the Unix FastFileSystem model).

195. GCC libraries won't build

Newsgroup: comp.sys.atari.st
Date: 1994-04-05 06:44:38 UTC
From: am136@FreeNet.Carleton.CA
Message-ID: <CnrxEF.Kyw@freenet.carleton.ca>
Source record: 189770

I've been trying to build the latest GCC libraries (from archive "libsrc97") under TOS on my STE. GNU Make didn't like the Makefile at all and produced a bus error (I think it choked on the rule for producing .o files from .cpp files), so I was attempting to compile everything by hand when I noticed that it wasn't going to work. From the Makefile:

```
GLIB2 = _muldi3.o _divdi3.o _moddi3.o _udivdi3.o _umoddi3.o _negdi2.o \
_lshrdi3.o _lshldi3.o _ashldi3.o _ashrdi3.o _udivmoddi4.o _cmpdi2.o \
_ucmpdi2.o _floatdidf.o _floatdisf.o _fixunsdfsi.o _fixunssfsi.o \
_fixunsdfdi.o _fixdfdi.o _fixunssfdi.o _fixsfdi.o _op_new.o \
_new_handler.o _op_delete.o _trampoline.o __main.o _ctor_list.o \
_dtor_list.o _ffsdi2.o
```

_floatdisf.o will (silently) overwrite _floatdidf.o, _fixunsdfdi.o will overwrite _fixunsdfsi.o, and _fixunssfdi.o will overwrite _fixunssfsi.o. "ar" will include the same file twice in the library in each of these cases. The only way around this seems to be to cross-compile on a platform without the 8+3 filename limit, or to indulge in some major hacking (renaming files, changing source code, and taking a binary editor to the resultant library).

Does anybody know if the current set of pre-built libraries were compiled:
a) on another platform;
b) with the -O2 and -fomit-frame-pointer flags, which is why I was trying to rebuild them in the first place?

I can only speak for myself: the nfs is currently in the file nfs-041.tgz, but there are no ftp sites for it :-)
Currently, there are last tests going on before release. If they are successful, it should be out very soon now.

There are some features I can talk about now: it uses Kay Roemers Socket interface, it is SUN-NFS compatible, works under MiNT only so far...

205. Need help: Falcon to Scart

Newsgroup: comp.sys.atari.st
Date: 1994-04-05 12:10:34 UTC
From: vdleij@phil.ruu.nl
Message-ID: <2nrkfq$ch1@laurel.phil.ruu.nl>
Source record: 189780

I just bought a TV with scart for my Falcon, but now to my anger it doesn't work (quite well). The problem is this. I connect it with a RGB monitor plug to a ST-Scart cable. After soem time the screen begins to flikker. I've located the problem: it's the 16 Hrz clock of the processer. If I set it to 8 Hrz, everything is cool. Demo's that use the VBL frequency of the TV crash with the lead, where they do not crash with a RF-lead. Somehow other program seem to fix this problem, as a game I'm programming. Cou

ld it be that a better VBI routine could remove this problem? If so let me now, and I'll program one. My final question is, is there a cable soemwhere with this problem fixed, as this seems to me easier than a siftware solutions (if it's possible) (i.e. AFalcon Scart lead).

Joost.

>Multitos,Geneva,etc available already!)

So you believe that people will not want to go for this OS because it is not compatible with existing software?

Lots of people (myself included) like to use other operating systems as well. I use UNIX, and sometimes Linux, on mainframes. I have Minix installed on my Atari hard Drive, and I use it......none of the Minix software is compat with TOS, and vice versa, but I still enjoy fiddling with Minix. A fair amount of people use Minix (including those that have other platforms....DOS,System7,etc)

What about all the interest in Linux for the 68030 range Atari....also Atari System V? Surely these are not compat with TOS. Or how about the interest over the net that's been shown for OMEn?

Yes, I agree that people will not want to give up their software investment, and why should they? A lot of people use different operating systems on their computer, and the respective software to go with it. So why the fuss with SMS2? It's not as though you will not be able to use TOS again, is it?

'nuff said.

Danny.

213. Apple CD300

Newsgroup: comp.sys.atari.st
Date: 1994-04-05 15:52:05 UTC
From: donaldp@scowpat
Message-ID: <1994Apr05.155205.18239@sco.com>
Source record: 189787

Does anyone know if the Apple CD300 Rom will work with an ST?
They are so cheap now that it is very tempting to get one!
If they do work, what software do I need to use one? I am
assuming that metados is enough, and that it will work with
MiNT. Am I missing anything?

Thanks,
Donald

This is just to let everyone know that ICD is starting to ship their latest version of the Pro Utilities (version 6.4.3 - if I didn't transpose the 4 and 3). I had ordered an update from them back in late January. I called in early March to see what was happening - and they said they were holding my order since a new version was just about to be released. I concurred with them that the wait would be worth it to me. Yesterday the new version arrived. No report yet on it. So to all the naysayers out there - sorry, but ICD is alive and well and still producing updates for our systems. Amen.

The latest one i've got was 2.05 but i heard there was an even higher version out - i DON`T mean Empire Deluxe! - but unfortunatly Interstel went out of Business some years ago,so getting this game will be next to impossible.

Not quite!
You say that Minix, Linux etc are not compatible with TOS. Well that is true.
But they ARE compatible with something else whereas SMS2 is completely new.

now 'nuff said.

Is there any way to get that game to work on a mega STe? I got it
quite some time ago, and it worked fine on my 520 ST and my friend's
1040 STfm, but it just hangs my mega STe with a black screen
immediately on booting. Also, on the 520 and I believe the 1040, it
crashed frequently when we went certain places on the second (I think)
level. Any suggestions? It's a fantastic game, if I could only get
it to work!

```
Proposal for a new newsgroup
Request for Discussion: comp.sys.atari.announce

by: Yat Siu (Lexicor@world.std.com)
-----------------------------------

Group name: comp.sys.atari.announce
Status: moderated (Lexicor@world.std.com)
Distribution: world-wide
Summary: a newsgroup for the product announcement of atari computer
hard and software or related (eg. clones).

Justification:

There are currently comp.sys.atari.st, comp.sys.atari.st.tech,
comp.sys.atari.8bit and comp.sys.atari.advocacy, the first three groups
are discussion forums for their (specific) related hard and software. Product
announcements in these discussion forums of new releases by either commercial,
shareware groups can often be considered a service but not encouraged. The
atari computer market is not very widely distributed and it is getting
increasingly harder to know more about new products.

To begin with a product announcement group would encourage the
people to announce their new products for the benefit of all atari computer
users. It will also allow the reader to focus for a new newsgroup only for
product announcements or press releases and will also make the reader more
aware of his/her options.

Charter:

The proposed group will provide a forum for the announcement and
release of new atari related products:

* atari computer hard and soft
* commercial as well as shareware or related
* announcement from individual authors, companies or distributors
* press releases

NOTE

This RFD is being issued in concordance with the guidelines set in the
"How to create a new usenet newsgroup" FAQ regularly posted to
news.announce.newgroups. Please refer to this article if you have any
questions about the newsgroup creation.

Unless the discussion indicated a need to resubmit a new RFD, the CFV will
be posted approximately three to four weeks after the posting of this RFD.
```

This RFD was (cross)-posted to the following groups:
news.announce.newgroups, news.groups, comp.sys.atari.st, comp.sys.atari.8bit

Discussion on or about this RFD should be in news.groups

If anyone wants details of SMS2 I have a press release thing at home from a show I went to that I can type up. I saw it running on a Mega STE (i think). The guy was trying to impress me by saying it was running 40 applications at once, when I pointed out none of them were actually doing _anything_ he didn't seem to put off...

Anyway I wish them the best of luck with it, the netorking stuff sure sounds impressive...

Source record: 189797
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Does anyone know what the DESKICON.RSC format is ? I know there are
some commercial editors, and one pd one that I know of, but no source
is available...

What I want to do is have a program that reads in the .xpm files I
have (some 6 Mbytes) and writes a file for me that the desktop will
read. I (obviously) don't want to use all these icons, but there are
some very nice ones. Basically they're all the windows icons converted
to Xpixmap form.

If the guy who wrote iconedit is reading this, I'd really appreciate
it if you sent me the above info.

ATB,
Simon.

>>> There are a few paragraphs about it in ST REVIEW April 94, at
first I thought it was an April Fools joke.
Should run on ST,TT,Falcon,Amiga and Mac. Graphics interface
similar to UNIX X-Windows. Crash window opens up with debug info.
Desktop is two screens, max 640x800 on standard ST.??
OMEn comes complete with assembler, debuggr and paint prg..
According to this article it says that OMEn should be available
on PD libraries shortly???. Mac version in May....
Is this all true?
Is expected to work on any hardware platform running OMEn.

>changing source code, and taking a binary editor to the resultant library).

You need to build the library either on a properly configured minixfs setup (while running MiNT) or on a TOS filesystem using UNIXMODE. See UNIXMODE.DOC in the library source distribution.

>Does anybody know if the current set of pre-built libraries were compiled:
>a) on another platform;
>b) with the -O2 and -fomit-frame-pointer flags, which is why I was trying
>to rebuild them in the first place?

The binaries of the GNU lib on atari.archive (at patchlevel 95) were built with a GCC 2.3.3 cross compiler and the default Makefile (which I believe specifies -O2 -fomit-frame-pointer).

Binaries and source of the latest release (PL98) will be forthcoming soon. I've got it built but haven't had the chance to package it up yet.

Be forewarned that there's an error in JRB's last update, that will cause the make process to destroy 2 source files. The version I'll post soon has a correctred 'mincl' that won't do that.

Cheers,

>to see this shit filling irrelevant newsgroups.

Sounds like a good idea. However, if you are ALSO going to be writing the postmaster, please stop for a moment and consider if you are being hasty.

Out of disgust for the Rhodes scam, I posted a PARODY of it a few days ago. It was NOT a subtle parody, but an OBVIOUS one, especially the title, which was

LOSE MONEY SUPER FAST!

It was built around the idea of a pyramid in which EVERY DIME went DIRECTLY TO ME.

Many, many people got a laugh out of it and wrote to tell me so. Thanks to all of them.

However, quite a shocking number of absolute simpletons did this:

1. Read the subject line (LOSE MONEY SUPER FAST!)
2. Were BARELY smart enough to make a connection to Dave Rhodes
3. Were NOT smart enough to notice the difference the word LOSE makes
4. Ignored the content of the actual post
5. Wrote nasty letters to myself AND my postmaster

This, people, is brainlessness an order greater than that displayed by the newbie dweebs who read the Rhodes post and think it will work. At least they have the excuse of ignorance of the Net.

Wes Simonds

230. compiling MiNT

Newsgroup: comp.sys.atari.st
Date: 1994-04-05 23:09:56 UTC
From: azog@world.std.com
Message-ID: <Cnt70L.GMv@world.std.com>
Source record: 189704

I got a suprizing amount of mail from people asking me to indeed
post the information I offered, regarding compiling MiNT with
the available resources one can readily gather off the net.

So here it is! (perhaps call this the mintbild.faq :-)

I take no credit for any information presented here. I simply
peiced everything together, after reading many pages of
often unrelated documentation.

All files mentioned here are available from atari.archive.umich.edu
(mirrored at wuarchive.wustl.edu, and nic.switch.ch, to name two).
Of course, all procedures here assume some sort of knowledge.

First, youll need GCC and its related support files.
You can find these in:

~/Mint/Libs/mntolb44.zoo
~/Mint/Libs/mntinc44.zoo
~/Gnustuff/Tos/Gcc/gcc258b.zoo

mntolb44 is the object libraries (ie: compiled). If you wish to
build the object libraries yourself, youll want to get mntlib44.zoo.

Youll also want make, unless you wish to compile each module by hand:

~/Gnustuff/Tos/Gnumake/gmake362.zoo

The makefile uses byacc:

~/Gnustuff/Tos/Bison/byacc.zoo

There are also two util files:

~/Mint/Gcc/butil33.zoo
~/Mint/Gcc/mgutil36.zoo

These contain stuff like gdb.

And youll need a good shell, one that passes parameters, and allows
you to set variables. Gulam works fine, or one of the version of
Bash. Define several variables:

```
setenv GCCEXEC /bin/gcc-
setenv GNULIB /lib
setenv GNUINC /include
setenv TEMP /tmp
set PATH /bin
```

GCCEXEC points to the .ttp files that you extracted from the GCC
binary distribution. I put mine in /bin (or \bin if you prefer),
along with make, byacc and others. This is a partial pathspec
(the gcc- tells gcc.ttp where to find stuff like gcc-cc1, etc)
GNULIB points to the OBJECT libraries
(ie the compiled .olb files) and GNUINC points to the header
include files. TEMP and PATH should be obvious. Defining these
variables are the most important parts of using GCC. Unfortunately,
nothing in the handy docs explains this. You can get a full discussion
of GCC for the ST in:

~/Gnustuff/Tos/Doc/gcc-doc-[dvi|txt].zoo

(the dvi files are for TeX users)

Edit the MiNT supplied makefile for anything you feel needs to be
changed, and then do a make! In about an hour, if all goes well,
you should have mint.prg. Feel free to do a make clean. Also,
for those who have Falcons or TTs, make mint030.prg will make a
68030 specific version. You should add the -mint switch to the
OBJS or OBJS030 lines, to flag gcc to use the MiNT libraries, rather
than the GNU libraries. I find the MiNT libraries work much better.

Thats it!

There are programs for the ST that make an MS-DOS bottsector to existing disks, so you don't need to re-format them. I can't remember the names of the software, but if you give me a couple of days I can check. Maybe somebody else out there knows.

>Correct. The question is whether the Atari drivers to support CDROM are
>transparent to the emulated PC Bios. IE from the PC BIOS does the CDROM driv
>appear to be another hard drive.

Basically this comes down to what ST CD-ROM drivers can be inserted between
TOS and the fake PC BIOS. If the PC emulator is a legal TOS program then
there should be no problem running METADOS or CDROM2Z.XFS before the PC
emulator - and then expecting the emulator to *ask* TOS what drive letters
are available. If all this happens then *yes* the CD-ROM should be
accessible to the PC emulator.

>You would not be able to take a PC SCSI driver and run it in the PC emulator
>and expect it to work since the driver would be hardware specific.

Yes - but this is not obvious to everybody.

>Remember also that SCSI drives aren't supported in the PC BIOS. This is wher
>there is hope that this would work. The emulator has to translate PC BIOS

True - but I would expect the PC emulator to have built in support for the
Atari SCSI drives (or to use a TOS harddisk driver), whereas I *wouldn't*
expect the PC emulator to have any support for CD-ROMS.

>calls into ST calls. If the ST BIOS supports calls to access the CDROM as
>another hard disk drive than, I'm virtually certain the emulator would be
>able to access the CDROM as described above.

Yes - agreed - *provided* the PC emulator goes via TOS (and hence any
loaded TOS CD-ROM drivers) in order to access its disks (hard, CD or
otherwise).

:-)

Roland.

BTW has anybody *tried* any of this? I have a CD-ROM drive but no PC
emulator.

Kommentar zu A57856@AC2 in der Gruppe CS.ATARI

Ahoi Donald,

please mail me if you got an answer.

Last week i installed the TCP/IP of the ,,Technische Universitaet Wien"
(TUW_TCP). The only problem is that it hasn't got any SLIP-driver. But i
found some sources in C which seem to be the elementary procedures of such
a driver.

With KA9Q (the version of 1989) i got a SLIP-connect using PING and TELNET.
Both computers were connected but a telnet session was impossible because
KA9Q collapsed after the connection was complete.

If i can get a not so expensive DLINK i would use it with TUW_TCP.

: sale and how much to expect to pay for such beast?

Rumor has it that Atari found a few in one of their warehouses recently
but only they know where the Stacy computers ended up. You might call
Best Electronics (408)-243-6950 or San Jose Computers (408)-995-5080;
they might know something about where to find one. If you find a new
one, expect to pay about $1200 for a Stacy 4. On the other hand, used
machines are available from time to time and can be had for as little as
$500 for a Stacy 4. Also, a little known fact is that the Stacy battery
packs are still available from Dragonware (406)-265-7300 for about $110.
I have a Stacy and I love it to bits... I'm about ready to
upgrade the HD and get a Fast Technologies Turbo 25 accelerator put in it.

Good Luck,

The Borg

>Does anyone know if the Apple CD300 Rom will work with an ST?
>They are so cheap now that it is very tempting to get one!
>If they do work, what software do I need to use one?

As for software, you can use:

1. MetaDOS for SingleTOS
2. CDROM.XFS for MultiTOS <= 1.04
3. Nothing? for MultiTOS > 1.04

BTW, I have heard one bad report from an Apple user about the CD300.
They said it was slow, but all CD-ROMs are slow, IMO.

240. Hooking up a 1.44 floppy drive

Newsgroup: comp.sys.atari.st
Date: 1994-04-06 03:42:00 UTC
From: stevenl@minerva.rolm.com
Message-ID: <2ntb28$deg@mack.eng.sc.rolm.com>
Source record: 189714

Awhile back, a company called DreamPark Development produced a kit that allowed you to hook up a 1.44 floppy drive to any ST computer. The problem is the documentation is missing but all the parts seem to be there. It contains the floppy drive, a board with a floppy controller, a ribbon cable, and a jumper. Does anyone have any info on how to do this?

] > Have I missed any? Any recommendations/good cheats?

Magic-Pockets - Graphically good but _very_ repetitive platform game
A soccer game the name of which eludes me :)

Cheats huh :) These are hard to come by for Bitmap Bros' games, but try
these:

Gods - Enter SORCERY as the level password for infinite lives.
(I suspect this is for the amiga version!)

Xenon 2 - Pause the game and type RUSSIAN AIR
Now, pressing 'N' will advance through the levels.

Both are probably for the amiga version. I haven't tried the cheat on
my version of Xenon-2 (Compilation version so it probably won't work!),
so I'm unsure of whether it works or not!
```

If they jumped to a hasty conclusion, it is because they are SICK AND TIRED of seeing _responses_ to the original chain letter, never mind the chain letter itself! And another response that looks like a chain letter

is just too much to wade through. Sure, I thought it was funny, but as
a student, I can take my time to read all the posts -- the same cannot be
said of everyone who reads the net. You'd be best to put **PARODY** in
the subject line to be sure it catches everyone's attention if you do this
sort of thing again.

Flames to /dev/null.
Hell, followups to /dev/null.
Let's kill this thread!

There is a program out there called MacMiNT which emulates MiNT on the
atari (MiNT is a replacement for TOS). This would allow you to run
well behaved .TOS and .TTP files. I don't think you've got much hope
of emulating GEM though. If you find anything out (or the MacMiNT
binaries, which I'm looking for) mail me please.

You should give a look to the Excellent BIG (BIG Is Gem) Library for Pure C
available everywhere (esp. at cnam.cnam.fr)....
It is freeware, the sources are available for 100 FF, the (good) doc and
Helpfile for Pure Help is in french and it does what you want and much more
with less pain than 'plain GEM', but fully (intented to be, but I didn't see
any problem) GEM compatible, works on STf, STE, (my) MEGA STE, TT, FALCON,
any screen rez, TOS/MultiTOS (and probably others)...

You Must give a look, it's an excellent job...

247. converting utility needed

Hi Folks,

I am posting this for a friend of mine. He has got a (very old) Atari ST
and is using "Protext" to do his wordprocessing. Now he needs a
program to convert his Protext documents to the format of MS-Word 5.5 (for
PCs). Is there any such program? If so, where can I get it from?
If not, are there any programs to convert Protext documents to any other
format?

Thank you for any help,

Wolf

For uncompressing, I like DCX_PLUS. It'll compress and uncompress .LZH,.ZIP, and .ZOO formats, and it's fast. Also like DMJ_GIF3 for .GIF conversions; it's got lots of bells and whistles. But I agree, GEMVIEW and SOL are both fine, also.
Will try to get both uploaded, if I don't screw the transfer up, soonest.

No I don't think it is. But it's a very nice little ``programmer's editor'',
specialising in things like allowing nice long lines and enabling you to
``fold'' bits of text out of sight to help you see the structure of your
code. I got quite fond of it before I decided to ``standardise'' on emacs
and its derivatives for as many as possible of the platforms I use.

Protext comes with a convert utility which will convert protext docs into
other formats. I can't remember exactly what they are (perhaps someone else
can) but I think that the newer version of protext (v6 possibly v5.5) support
RTF, which word can load.

Your friend should check the convert program to see what formats it handles,
and then check the import options of MS-Word 5.5 and see which ones match up.
If all else fails then just save it from protext as ascii.

I've compiled it with both 5.52 and 5.6. The resulting binary is very stable,
certainly more so than the version 1.04 that came with my Falcon.

>Particularly, how does one _create_ a virtual hard disk? And how does

If I recall correctly, you'll have to register for that and and then you
will receive a program which does so...

>anyone had problems with crashes on non-STs? (ie STE and beyond)

Worked fine on my 1040STE, though the emulation is quite limited.
No DLI's, no PMG's, no GTIA modes.... well, see for yourself. BTW,
in the very near future, an atari 8-bit emulator for XWindows will be
released. Watch the comp.sys.atari.8bit newsgroup carefully for that.
It's supposed to be a lot better then ST XFormer. (Including all the
things STXFormer lacks...)

Greets,
Ivo.

Version 1.38? Is it on the archive? I use v1.36 with great pleasure, no
troubles at all. (except for the bug the original desktop also has...
it bombs quite often when sectors or tracks are unreadable...)
What has been changed in v1.38 compared to v1.36 ?

>It bombs with 2 bombs on my 1040 STE with Tos 1.62/2.06.
>Any ideas..?? Someone..??

Ah... bad luck. Think I'll stick to v1.36. I own a 1040STE also..

Ivo.

261. Atari SLM804 Laser Printer: Almost a giveaway

Newsgroup: comp.sys.atari.st
Date: 1994-04-06 14:46:32 UTC
From: djs@jet.uk
Message-ID: <1994Apr6.144632.1129@jet.uk>
Source record: 189736
Cross-posted to: comp.sys.atari.st,uk.forsale

I have the above printer, including the SLMC804 DMA interface/controller
to (almost) give away.

You would need to pick it up (from Reading). You will need to buy some
new toner (about 30 quid IIRC). It needs a cleanout (from spilled toner
powder).

Manuals, software drivers etc included. Before the spillage, the
printer was in fine working order.

Make me an offer, or it gets thrown away at the weekend.

262. Re: SuperCharger PC Emulator...

Newsgroup: comp.sys.atari.st
Date: 1994-04-06 14:48:35 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HAUOAT3VUA8WWFY9@SNYONEVA.CC.ONEONTA.EDU>
Source record: 189737

Yeah, I remember the SUPERCHARGER...

I never used it but saw many ads and read many reviews about it. As far as I know it had the following specs:

* 512kb or 1 meg of RAM (later models had 1 meg)
* A NEC V30 CPU (8086 clone) @8mhz (I think)
* Emulates CGA and Monochrome modes only
* Attaches to all STs via the ASCI DMA port
* Supports most HD drives
* Doesn't do PC sound (i.e. beeps)
* Has expansion ports for later options like a VGA board and CPU upgrade, etc.
* Can uses all Atari ports except the MIDI ports.
* Can run in the backgroudn with TOS so you can switch between the PC and ST

All in all, I heard this was a good system for basic PC emulation.
The built-in RAM could be used as a RAM disk when the Supercharger wasn't used.

However, before buying be sure that you have the latest software update as earlier software drivers had some problems with the STe systems. Also, I'm not sure the system works with the TT or Falcon (the Falcon doesn't have the DMA connector!)

Finally, the emulator was imported from Europe. I'm not sure the company is around so updates and upgrades may be hard to find.

Originally, the Supercharger sold for $399 to $450. As PC-XT clones (complete) can be bought for as little as $50-100 new in New York City when new - don't pay too much!!!

Hope this helps you out...

Your best bet is to buy someones old Mega4, your second best bet is to purchase a memory upgrade card. I say this because some (not all) Mega2's are Mega2's because they couldn't be Mega4's. Now while this may not be your machine do you really want to drop the money on the memory only to find out you have bad leads on your mother board. I've seen this happen twice in my local area so be careful.

I seem to remember that they were pretty neat, but (at the time) expensive.
You could switch between PC and ST screens with a hot key, and could use
the memory in the Supercharger unit as a ram disk when it was not being used
for PC stuff. Also, I think you could daisy-chain more than one Supercharger
and switch between them. It should connect to the DMA port.

I remember that the software was well updated for awhile, with new versions
coming out every few weeks.

|>

It's probably because squeezing 8bit samples out of the crummy PSG chip requires
demo type tricks (typically disabling/diverting system interrupts)
which may be incompatible with GEM (particularly mouse control).

While I haven't gotten a lot of help from Atari Management (much the opposite)
they do have some good people working in the tech area.

I called there after I got my Falcon because it had a problem with the internal
hard disk, and I didn't know which printer driver to use for my Epson L-1000.
I was promptly told how to fix my hard disk problem (although they recommended
that a dealer do the fix), and that I needed the Star NB-24 driver.

If only their management was that responsive!

From: translat@csi.compuserve.com
Message-ID: <2nutea$s33@mhaai.inhouse.compuserve.com>
Source record: 189747

Are there any PD-with-source hard disk drivers which do not poll the done flag but rather use the interrupt - as in "real" operating systems? I know Minix works this way - how about Mint and MultiTos?

A smaller question - studying most HD drivers I find some sort of "settle time" delay, e.g. they don't even begin to issue commands until at least 5msec have elapsed since the last operation. Why is this necessary?

The MiNT kernel uses (almost?) nothing from the libs. So it doesn't
matter what libraries you use to compile the kernel itself.

280. Falcon Games - we want 'em..!

Newsgroup: comp.sys.atari.st
Date: 1994-04-06 21:59:37 UTC
From: THIETAVUO@FINABO.ABO.FI
Message-ID: <1994Apr6.215937.18789@abo.fi>
Source record: 189653

There are some rumours going around concerning the version of DOOM for Atari Falcon. We all know that id Software developes the Jaguar Doom on Falcon-030. The game would be possible to convert to F-030 - but the question is: WHY will they NOT do it..? Is it, because nobody seems to be interested? Or is it the common policy just to ignore all Atari computer user's needs..? I've been wondering, whether the Amoeba-users are more clever than us - by making more NOISE about what they want..?
I've been wondering, why nobody seems to be interested in new ST-games' Falcon-compatibility. In Atari-magazines, at least.. In ST-format, of ST-User, e.g you see game reviews - but seldom any comments about what's working on the Falcon-bird. No big wonder that the game-houses just laugh at us - if they even know that F-030 exists..!
In AEO magazine everybody's talking about the Jag. O.K - it is a nice console, and probably well worth buying - but: if Atari intends to make computers in the future, the Falcon MUST be supported better now. It's easy to understand that all the money goes to the Jag - for a while, at least. But it would (will?) be relatively easy and cheap to keep existing F-030 owners relatively happy, by giving them what they were promised a long ago: DSP modem, Falcon games, better CPU case (Mega-STE/TT-style?), and so on. It would also be very easy to give people a 68040-alternative, since especially German professionals really need that extra power. Commodore and Apple have managed to do it..
I'm talking about Atari Corporation's image; a believable company needs some products that may not make so much money - but make people see that "this company IS able to do e.g powerful 040-Falcons". Some people need them more than others. But F-040 could be done - and in my opinion, should be done..

And... Where is MP Formula One Grand Prix for Falcon..? They could convert the existing, very good PC-version VERY quickly and easily. And almost every Falcon-gamer would buy one, since we don't have such games..
Conclusion: MicroProse would NOT lose money, and very many of us would become EXTREMELY happy... They can do it, if they just want to. But will they? If some of you, reading this, can help - please, pass the message! Alone we can't change things - but maybe together..? Ideas, thoughts, action..?!

P.S - Indy Car racing game wouldn't be bad either - so... Maybe?

Diamond Edge 1.10 is probably the best HD repair/optimizer-program at the moment. It's incredibly fast, and very reliable - and supports well all kinds of SCSI-, IDE- and other HDD:s. I wouldn't use Atari's own Checkdisk except in desperate situation (buggy, very slow..) - nor other PD/SW organizers. That above mentioned Diskus may be very good also - just wish they'd translate it in english.. ;-)

>it read the GEMini Atari CD-ROM disk? This is the only function I have for
>the drive at the moment.

Probably

I have an NEC CDR-37 CD-ROM attached to a MSTE with a ICD ADDSCSI+ host
adaptor. This reads standard ISO9660 CD-ROMs fine. I haven't got the GEMini
CD-ROM yet, but its 99% likely to be ISO9660 format so that should work.

BTW you will need a CD-ROM driver. The Atari MetaDOS ones are available
by ftp (AFAIK).

Also you might need to play arround with SCSI ids/termination etc.

The only way to find out for sure it to try it.

:-)

Roland.

>Does anyone know if the Apple CD300 Rom will work with an ST?

Apparently so - although I have a NEC CDR-37 myself ;-)

>If they do work, what software do I need to use one? I am
>assuming that metados is enough, and that it will work with
>MiNT. Am I missing anything?

MetaDOS should be enough - although it is AFAIK *not* MiNT compatible.
There is a MiNT CD-ROM driver which is available on the ICD Pro utilities disk
among other places. Its not PD/Freeware however.

:-)

Simply put, ST games and Falcon games from major developers are a pipe dream in the era of PC clones and cheap MACs...

Why? It's a matter of economics!

In the US, there may be only 20,000 active Atari users still around against as many as 50 million PC owners!!!

Atari won't even release official sales figures for its hardware. Without accurate numbers - marketing research efforts are all but useless.

After countless failures in the Atari market - many developers don't even bother to produce Atari stuff anymore. Could you blame them?

1) Atari barely supports their hardware
2) There are only two US Atari mags in print and a half-dozen on-line and disk mags to advertise products in. Compare this to the PC world where there are literally dozens of publications!
3) Software development on a commercial scale is costly. There are lots of costs and expenses involved. No developer wants to lose money on each product!

4) Atari hardware and Software (in the US) is only available from a couple of hundred dealers. Compare this to a couple of hundred locations for the PC in just one city like LA or New York!

Now, I know the European market is more promising than it is in the US but the figures show that Commodore sold substantially more hardware than Atari did and PC clones are getting cheaper and more competitive.

Developers follow the scent of money! Even if 75% of PC and AMiga owners are pirates (just a figure for illustration), due to their vastly superior installed numbers, supporting these machines with software is a safer bet.

Development costs are cheaper too for these platforms as there is a larger talent pool, wide accessibility to hardware, company support, and easy to obtain sales and consumer data.

This is not to say that the Atari market is devoid of talent - quite the contrary! However, many potential Atari developers are simply turned off by the uncertain future of the platform and the fact that they will earn FAR LESS money on the Atari market than they could in the PC or even the Amiga markets for the same work and time, etc.

I don't want to flame Atari but let's be honest with eachother and stop hoping for things which are unlikely to come!

granted, there have been some best selling games in the Atari market (even recently), but these success stories are few and far between...

I would also like to buy some Falcon specific games!

Just a few thoughts....

Ari

I have the Supercharger 1.4 all the PC benchmark progs like Norton Speed Test tell me that it is running at 16Mhz. The benchmarks also say that it is a 286- although I'm not sure(It uses a Nec V30-not an Intel chip). It connects to the DMA out port on an acsi hd like the megafile. I would recommend getting Dos 5.0...you will find a noticable speed up. Formats floppies fine and I have no problem reading these disks on all sorts of PC's running dos, OS2, and Windoze. It has a program so that u can use the Supercharger's 1 meg of memory when in TOS mode. There is also a program that is supposed to let you use the STE's ram(I have 4 meg), but the instructions are very vague and I have been unable to set it up.
Write me if you have questions.

Hi,

I'm not sure if one exists, but I am looking for a Multitrack Sequencer for my Atari 1040ST(f). The only catch is that it will play *.AVR samples without the use of a MIDI. I am using a Replay 16 and I hook it right into my stereo mixer or 4-Track. The Replay 16 Editor has a built in 1-Track Sequencer, but it would be a lot easier to do what I am doing with at least a 2-Track Sequencer, if not more tracks. All the ones I have seen in PD so far seem to require a MIDI keyboard. Thanks,

Theron

] For uncompressing, I like DCX_PLUS. It'll compress and uncompress .LZH,.ZI
] and .ZOO formats, and it's fast. Also like DMJ_GIF3 for .GIF conversions;
] it's got lots of bells and whistles. But I agree, GEMVIEW and SOL are both
] fine, also.
] Will try to get both uploaded, if I don't screw the transfer up, soonest.

DCX also handles .ARC which some people are _still_ using, despite the fact
that Lharc can be used with virtually the same switches, and do things
in much less time, at much greater efficiency! :)

DCXtract won't work on pre TOS 1.4 machines, but it certainly comes in
handy as a pretty decent do-it-all archiver/dearchiver!

DMJ_GIF for GIF conversion? No way, use 'Photochrome', the results
are MUCH better, and done in about a tenth of the time!
```

293. OMEN?

It was none other than Wayne Barnes that wrote on 05 Apr 94 that ,
WB> OMEn comes complete with assembler, debuggr and paint prg..
WB> According to this article it says that OMEn should be available
WB> on PD libraries shortly???. Mac version in May....
WB> Is this all true?

As for the substance of what they said ...don't know . But Application's had an editorial about it aswell so I expect there is 'something' to it.

WB> Is expected to work on any hardware platform running OMEn.

I certainly sound's quite promising but exactly what 'Compatible with current GEM compiler's' mean's is somewhat vague. If it can recompile GEM source into OMEn Compatible code it'll be absolutely amazing but I seriously doubt if it will !

Someone has said it may already available . Hope someone hatch's it out on the Atari file echo's.Definately worth a look i'd say.

I've never seen this problem before either, with ROM TOS 4.01 or RAM TOS
4.04. While Patrik's advice is very good in general, it's not something
I'd spend a lot of time worrying about. Specifically for serial ports,
the RS232 standard requires them to tolerate normal signals up to 25 volts,
and I doubt you can generate glitches of this magnitude just by pulling
a cable. Static discharges can be hundreds or thousands of volts, but
they're not going to occur across two conductors like this...

>Actually, I would like to ask if you could try this.
>Thanx in advance.

Yes, the RAM must be 32 bits wide. Fine. If you browse thru catalogs for memory suppliers, you will occasionally find 2 MB SIMMs. You could use 4 of these to provide 8 MB of RAM, assuming your board handled 2 MB SIMMs properly. Personally, I wouldn't bother with this route, 2 MB SIMMs are probably just doctored up from pairs of 1 MB SIMMs or somesuch. Not much use when the time comes to upgrade further...

>they NOT do it..? Is it, because nobody seems to be interested? Or is it the
>common policy just to ignore all Atari computer user's needs..? I've been

Developing Falcon games and developing Jaguar games ON a Falcon are
two COMPLETELY DIFFERENT THINGS! They aren't interchangeable at all,
so Id Software would have to start a Falcon version from scratch --
and there just isn't the money there to make it worth it (unless EVERY
Falcon030 owner bought a copy!). And that answers why hardly anyone
else is doing Falcon games -- there's only about 25,000 or so Falcon030
owners, so unless a bare minimum of 50% (but preferably 75-100%!) of
all Falcon030 owners can be expected to buy it, it doesn't make sense
financially for developers to bother with it. Most Falcon games done
so far (commercial ones, of which there are only about a dozen!) were
subsidised by Atari -- and the ones NOT done by Atari are mostly
upgraded versions of ST games (better graphics).

I know it's painful thinking about this, but if YOU were running a
software development company, YOU would do what's in the best financial
interest of your company -- just what everyone else is doing! That's
for Falcon games, though. I still believe there's a quite viable market
for ST games, though (and there's little or no reason to NOT make ST/STE
games Falcon-compatible). Atari owners are a bit more picky about the
software they buy, so it's harder to tell what kind of games to make.
Some developers release a mediocre game for the ST and, after it doesn't
sell, they proclaim the ST market dead and refuse to do anything else
for the ST. However, there are STILL some games that come out that end
up selling QUITE well for the ST (and even outsell the same title on
other platforms!).

In <2og9do$c54@percy.cs.bham.ac.uk>, Chris Ridd writes:

[> There is no documentation for the library, which might be a problem.

This is not really a problem; I've used EGEM for the installation program
of MasterBrowse and the entire ESS-Code program. All the documentation
you need is in the example program source code. It pretty much shows
you how functions should be called and how your program needs to be
structured to use EGEM. The STARTUP.RSC file contains all of the
extended objects, so you can just paste them to your resource file
and you are ready to go. The only thing I had trouble with was the
concept of being able to open any dialog box at any time, regardless of
the fact that others are currently open. Working out how _that_ should
be done was a real problem for me.

[> Also, E_GEM programs (inc. LZHSHELL 2.99) tend to override any changes
[> the user makes to the .RSC files (eg changing colours), which is not
[> good practice.

In general, it is not good practice to edit the resource files of
programs. They are the way they are for a very good reason, usally
(though colours are not usually critical, positioning often is.) I
would not blame this on EGEM, though. It is a function of the
program in question. For example, LZHSHELL allows you to change
colours from inside the program. What is happening in that case is that
the program is setting the colours to the colours used as the
defaults.

ATARI COMPUTER FOR SALE

ATARI 1040 STE - 4 Megabytes of Ram, Tos 1.62, stereo outputs
DMA sound, enhanced joystick ports, 4096 pallete.

ATARI SC1435 - 14' Color Stereo Monitor
Includes swivel stand and stereo cables comming from
the computer. Nice display.

Maxtor LXT 200S - 200 Megabyte 15ms Hard Drive, recently purchased
as an upgrade to a Segate 20 Megabyte Drive.
Installed in original case so there may be room
for another HD. Alot of room at high speed, VERY
very quiet.

ICD Host Adapter Plus w/clock + Software/utils is also installed in
this case. Have the original manual/disk as well as the latest
software upgrade on the hard drive.

Epson LQ-570 - 24 Pin printer, 11 built in fonts, 360x360 dpi
Can use both single sheets/envelopes, etc. or printer paper. Very
nice quality for text/graphics. Has a new ribbon, and a box of
printer paper.

Supra 2400 Baud Modem - A modem, yea.

Already installed on the hard drive, all sorts of utilities and shareware/pd
programs. This
system is in NEW condition, not used much and still in boxes with all
manuals. It was mainly used for simple word processing for school
using Word Up(included). This is the perfect system to learn on,
with plenty of memory and room to get into advanced things such as
programming(C Compiler on the HD), etc.

Need money bad, so I have to let this all go. Sorry I will __*NOT*__
sell this system in parts whatsoever. If you have any questions or
are interested, please let me know.

Asking $1200 obo.

Mail only please.

[> ST community.

True. As you say, our products are aimed at a different group of users.
On the other hand, they are both "viewers" so there will be some degree
of friendly competition. The end user will, of course, be the one to
benefit.

[> One thing that I think I can say without
[> causing a huge flame-war is that the RDD is probably the fastest due to
[> the fact it's not using GEM but it's own highly optimized routines.

Yes, I agree with you on this point as well. The RDD is the fastest
viewer available. MasterBrowse can be very fast, if used with Warp 9
or NVDI, but it is still not as fast as the RDD. As you say, this is
because MasterBrowse has to conform to the limitations of GEM. The only
way around this is to scroll by more than one line at a time (which
MasterBrowse will allow you to do).

305. Re: JPEG viewer for the ST? Where?

Newsgroup: comp.sys.atari.st
Date: 1994-04-07 08:38:17 UTC
From: oldcornd@cs.man.ac.uk
Message-ID: <1994Apr7.093817@cs.man.ac.uk>
Source record: 189680

There aren't many JPEG viewers for the ordinary ST out there for two reasons:
1) an ST would be SO SLOW! at decompressing a JPEG (without the Falcon's 030, which has fast multiply and 16MHz op)
2) JPEG's are inherently going to be real-world images. I know Photochrome can do an impressive job, but you would realistically be limited to greyscale.

There is also the fact that you need a lot of memory to do the job... with most ST's out there still only 1 Meg, it would be tricky to do any picture of reasonable size.

But if there is a LOT of interest out there, I could convert mine to run on an ordinary ST... it would be quite a bit of work so there would need to be quite some interest. And it would only work in greyscale (320x200 16 grey shades) because I can't do what Photochrome does.

Comments and mail messages welcome
Dave Oldcorn

(Falcon JPEG viewer now at 3.5s for 640x400)

306. Problem with gemini and env vars

Newsgroup: comp.sys.atari.st
Date: 1994-04-07 09:15:11 UTC
From: pschalie@mswe.dnet.ms.philips.nl
Message-ID: <1994Apr7.101511.131860@mswe.dnet.ms.philips.nl>
Source record: 189681
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have a problem with GEMINI 1.99.
Several programs (make, cc) seem to "forget" the environment
varables when started from the console window. They cant fing the
programs they are supposed to kick off (cc in the case of make, and
cc0 in the case of cc).
When i leave gemini and start a shell (msh or gulam) from the atari
desktop all works well.
I have tried to use gemenv.prg, but gemini starts to complain about
illegal env names (ENV$ROOTSIZE and ENV$OPTIONS). other env
variables defined in the root.env file are available in gemini, but
the problem with make and cc still remains.
Can anybody help me?

I have heard about it from several sources so it looks pretty much as if it does exist. It will be shareware, not PD BTW.

Thats about all I know.

I use and recommend MVG from WizWorks. It's commercial and it doesn't do quite a few of the neater drawing functions that the big packages do, but it's excellent as an image manipulator and it's fast, damn fast!

The manual's well worth reading, too, as are all of Dr. Bob's.

I think it only means you can use Atari GEM compilers to compile code written for OMEn.

Quoting from the February 1992 OMEn newsletter:

"In addition, ATARI-GEM format programs (sorry, NOT GEM programs, just the GEM executable file FORMAT!) will work with OMEn, making it possible to use GEM based compilers (Assembler, C, Modula2, Pascal, etc) to write OMEn software. The development setup would include an Atari computer running the compiler to create the program, and any computer running OMEn to test it on, with a floppy disk being used to transfer the program to the test machine. Until appropriate interface libraries are created, a bit of in-line assembly will be required here and there for OMEn system and I/O calls."

> Postscript, does this exist?

If NetPBM or PBMplus is installed, this should work:

gemtopbm foo.img | p?mtops > foo.ps

Then print foo.ps the normal way. I'm not sure if it's ppmtops,
pnmtops, pgmtops, or pbmtops. You can find out like this (if you use
csh or possibly bash; dunno what you'd do in /bin/sh or ksh or zsh):

pushd `which gemtopbm`; lc p?mtops; popd

>a system such as the ST.... I can't imagine it being a big hit!

Yes, but the OS is compatible across a wide range of machines.....PC,MAC,Amiga

Think about it.....Open Systems.....

Computing will become a nicer hobby, and less backstabbing/flaming other
computer users.

Software available for the ST, can be used o the other computers.

Just like UNIX. Most UNIX software can be used on a number of machines, just as
long as they too are running UNIX.

What about connectivity? If OMEn takes off, you won't have the need for a
different machine (PC) at work so that you can run Vista eXeed (for X Windows),
or the need for Windows for Workgroups. You can have an Atari sitting on your
desk at work, connected to the network with no problems.

Of course, it is a new OS, and of course it will have some problems, but isn't
that the same with all new OSs? eg, OS/2, or even UNIX(which were accepted by
the Uni's, but not by businesses until fairly recently).

Just think about it........ 8*)

326. QWK for BBS express

Newsgroup: comp.sys.atari.st
Date: 1994-04-07 15:26:09 UTC
From: carl@picard.infonet.net
Message-ID: <2o18mh$d02@insosf1.infonet.net>
Source record: 189698

I have posted this question once but I forgot which group I posted in. So I thought I would hit them all:)

I was wondering if there is a QWK compatible door for BBS express 1.87(I think). This is for a friend who does not have access to the net but wanted me to check for him.

I am currently reading this group and find out now that I wish I had had an atari when I first started out. These seem like nice machines. Anyway, I am cosysop on his board in charge of the MSDOS files.

A shameless plug is in order. If anyone wants to check it out the number is 1 606 886 0914. It is kinda small right now but growing. The BBS is called Darkforce BBS and supports 1200-14.4 callers.

Any help anyone can give will be greatly appreciated.

Instead of using the microphone jack, try using the "aux" or "tape2" (RCA pinplug pair). Get yourself a decent RCA patch cord (I bought a gold tipped one for about $10) and plug it into computer and boom box. Mine sounds great.

You should only need a standard RCA pinplug pair patch cord, no adaptors or anything. You are getting shitty sound from the microphone jacks because they are not designed for amplified input.

Users with a small amount of memory should look for a gcc-2.3.3.

> mntolb44 is the object libraries (ie: compiled). If you wish to
> build the object libraries yourself, youll want to get mntlib44.zoo.

Note: Builing the MiNT-Library will need about 12 hours. Using gcc on
a minix-filesystem will help a lot!

> Youll also want make, unless you wish to compile each module by hand:

> ~/Gnustuff/Tos/Gnumake/gmake362.zoo

Get GNU make 3.68 or later.

> The makefile uses byacc:

> ~/Gnustuff/Tos/Bison/byacc.zoo

Not really needed, because asmtrans.ttp is included in the Sources of
MiNT. Just comment the asmtrans-part out and make sure this binary is
not deleted if you do a "make clean".

> There are also two util files:

> ~/Mint/Gcc/butil33.zoo
> ~/Mint/Gcc/mgutil36.zoo

You only need one of these Files: PL36. (BTW: PL37 is out for months).

> These contain stuff like gdb.

No. The debugger is in a seperate package. You need this package
because it contains the linker (gcc-ld). There are also some tools
like xstrip, printstk, fixstk, gcc-ar included.

> And youll need a good shell, one that passes parameters, and allows
> you to set variables. Gulam works fine, or one of the version of
> Bash. Define several variables:

Many versions of bash are broken and gulam is not a MiNT aware shell
(no job control, ugh!). Get ksh or tcsh if you have problems.

> setenv GCCEXEC /bin/gcc-

Not needed if the gcc-* are in /usr/lib/gcc-*

> setenv GNULIB /lib

Not needed if the *.{o,olb} are in /usr/lib

> setenv GNUINC /include

Not needed, if the header files are in /usr/include

> setenv TEMP /tmp

Not needed for gcc, if it is in /tmp. But helpful for other programs.

> set PATH /bin

Mandatory. Only gcc.ttp and the tools without gcc-* reside in one of
the directories in PATH.

> GCCEXEC points to the .ttp files that you extracted from the GCC
> binary distribution. I put mine in /bin (or \bin if you prefer),

You should set your environment variables with backslashes '\' and put
them into the environment-variable PCONVERT - a comma seperated list
of environment variables.

Bye,
Knarf

ip>I was wondering which alternative desktops exist for the Atari ST.
ip>I know of Teradesk and KaosDesk which I own both. (I use TeraDesk
ip>mostly because Kaosdesk sometimes bombs on me...) Which others are
ip>available both PD/Shareware and commercially ?

Gemini (v1.99, 31-12-93) is probably the most complete, functional
and comfortable:
- build-in unix-like cli (in window on desktop)
- two icon-sizes / gdos fonts for windows
- icons on desktop (ofcourse)
- virtual-links (or how do they call 'm): sort of automatically
generated batchfiles. (Alowes for neat organisation of all your apps)
- smart acc-protocol: acc's can be installed as application , klicking
on a file will open the acc-window on the desktop getting the name
of the file passed as parameter. If written for use with gemini:
1st-view, gemview, acc-clock, browser, takeoff (app-launcher),
treeview, imploid (-very- neat archive acc in window)
- multiple file-names can be passed to apps.
- can start apps as overlay (gemini is removed from ram, freeing
memory for the app, later restarted)

This list of features is far from complete, but i think gemini is the
best. It is rather large (1.5MB) and takes up several 100KB ram (but see
last point above).

Ease is a commercial package, with some of the features of gemini
(acc-protocol) and some features no other desktop has (close-window-
in-one-go and window-to-background gadgets). Is smaller than gemini.
I bought this package, but now use gemini again...

If you have little HD en RAM -space, i think Teradesk is best (v1.38
is the latest).

I also had problems with the tuw_tcp, forget using it under MTOS and I had to really jimmy it around to work at all on my Falcon under normal TOS. Anyone had any success with the New MiNT packages. That might be the route to go.

] > registering a $5 program is like giving money to the banks ...
]
] One possibility to waste less money on the bank is to make a joint contribu
] from several people in your country at once. This way, you pay less overhea
] and also make it easiser for the receiver to cash the money. I've done this
] myself on several occasions with good result.

I just wrap up the equivalent amount of local currency required in the
letter describing what I want and where to send it! Then, the next time
the receiver is near a major bank, or 'Bureau De Change', or an Airport,
they can change the currency to the local one. That way, no-one loses
anything unless they charge for the currency conversion which I'm not
sure about! It's always worked in the past, (I registered Antidote and
Utopos using this method and the authors were quiet happy with the method!)

Just to stir things up a litle. But sorry programming on the Jag and on the Falcon are not completely different. In Id's case it would be because of the direction the are coming into it from, but if you have extensive knowledge programming on the Atari 680x0 series you have a leg up on outsiders. In reality there is a lot of comparison between the Jag and the Falcon from an Atari programmers point of view. If you can make the Falcon jump through hoops then the jaguar just gives you more toys.

Teradesk v1.38
Geneva v1.2 (Not _really_ a replacement desktop, but it can be used
as one!)
NeoDesk v3.03/v3.04/(v4.xx) - The BEST there is, commercial.
Gemini v1.99?
KaosDesk v? Old but small and does most of what is needed

There's lots more, but that's the major ones!

It is vaporware but that's not the case with 'most' Falcon apps. We have a real Cubase Audio available with a 16 track version coming soon. HiSoft Voice Mail system will be available shortly (I have it here working). There are many programs that make use of the DSP, the extra resolutions, etc.

NeoDesk is the best (IMO). I was mortified when it didn't run on my Falcon,
and I had to cope with the TOSsy desktop. I now have a Falcon version
of NeoDesk (v3.03).

3.04 is the latest, but that's justs 3.03 with a few patches to make it work
with Geneva. Version 4 has been RSN for some time...

> do an impressive job, but you would realistically be limited to greyscale.
>...
At the risk of repeating something earlier in this thread (I missed the
start of it), GemView (German shareware, docs/menus etc also supplied
in English) works on an ST. It decodes and displays multiple formats
(incl JPEG) and can save in many formats too (eg uncompress your JPEGs
to 24-bit colour TIFF, if you want, even on a mono ST). Of course,
it's not as fast as on the Falcon, where it will utilise the Brainstorm
DSP decoder if available, but it works. Registration is 18 quid (UK)
or something like 40DM (Germany). I think someone (Lexicor?) handles
registrations in the US. Free versions (with a few limitations) are
available at the usual sites.

The latest Purple Mountain Computers ad has two TouchUp's listed.
One says "TouchUp" for $12, the other "TouchUp 1.6" for $39. This is
a used software company, by the way.

Their number is: (206) 399-8700.

350. Calamus DTP Guide - where?

Newsgroup: comp.sys.atari.st
Date: 1994-04-07 22:13:09 UTC
From: cordes@ac.dal.ca
Message-ID: <1994Apr7.191309.22772@dal1>
Source record: 189625

As a recent purchaser of Calamus 1.09N, I'm looking for the 'Guide to Calamus Desktop Publishing'. DMC doesn't have any more supplies (and doesn't plan any more print runs) and Toad apparently hasn't had any in stock for several months. Any suggestions? TIA.

John

351. Falcon paint program: Rainbow!

Newsgroup: comp.sys.atari.st
Date: 1994-04-07 22:30:30 UTC
From: ac382@FreeNet.Carleton.CA
Message-ID: <Cnwulu.258@freenet.carleton.ca>
Source record: 189626

Have any of the Falcon users out there seen the Falcon paint program called Rainbow? It looks GREAT! Even though it is quite limited in its features (it is only a demo version) it looks like it has a lot of promise. It works very well on both RGB and VGA monitors. On my SVGA I can even get 320x280. It reminds me a lot of Neochrome on the ST. The program is extremely small (written in assembly I believe) and uses hardware scrolling to move about a virtual screen (all the tools don't fit on screen at once).

Does anyone know if the authors are on the net? Is the final version complete? I am definately interested in getting this program. (I found it on ftp.tu-clausthal.de /pub/atari/falcon/graphics/painter)

If you have any information please post it here.

thanks

352. Calamus UPGRADE AND AMNESTY OFFER

Newsgroup: comp.sys.atari.st
Date: 1994-04-07 23:07:18 UTC
From: warwick@cs.uq.oz.au
Message-ID: <2o23n7$1ij@uqcspe.cs.uq.oz.au>
Source record: 189627

All North American DTP users, even pirates, read this:

UPGRADE AND AMNESTY OFFER

DMC will upgrade any other Atari DTP program to Calamus SL for US $200.00 or $260.00 CDN. (A pirate version of Calamus counts during this one-time offer. This amnesty will not be repeated).

Simply put, I am offering you the exact same upgrade price that I offered to my own Calamus 1.09N customers. I think you'll agree that I cannot do better than that. Please take advantage of our offer. You will not be sorry.

To order, send DMC a photocopy by mail or fax of your original DTP program disks from whichever program you are using, (a screen snap shot of your Calamus info screen located in the top left-hand corner of the program if you have a pirate version or just mail in the disk) your name, address, telephone number and a listing of the computer equipment that you own, plus the upgrade fee of US $200.00, or $260.00 CDN. and $10.00 for shipping and insurance in North America. Payment made be made by Visa, Mastercard or Money Order in Canadian or US dollars by telephone, fax or email.

DMC recognizes that you can become comfortable using a program. Further, we acknowledge that there are many excellent features in other DTP programs which may be of value to you. We do not ask you to trade in your original disks. Keep them. We're confident that once you learn Calamus SL you'll never look back! This offer, extended to all Atari computer owners in North America, will expire May 30, 1994 and will not be repeated.

//// Calamus SL

As was anticipated, the new modular design of Calamus SL has become the centre of a powerful and ever-expanding universe of desktop publishing tools.

The standard Calamus SL package contains:

[] A 600 page manual
[] Four program disks with 12 standard modules:
[] Clipboard Module
[] Page Module
[] Frame Module
[] Text Module

[] Text Style Module
[] Line Module
[] Raster Area Module
[] Document Converter Module
[] System Parameters Module
[] PKS-Write Module
[] Raster Generator Module
[] Focoltone Module
[] Printer Driver Generator Utility

The above, along with the main Calamus SL shell, contains over 1,000 features!

For those of you familiar with Calamus 1.09N, new features and powerful enhancements from Calamus 1.09N to Calamus SL include:

The ability to accept modules, internal or third party. The ability to process and pre-process large passages of text with speed and precision. Extended raster control with freely definable raster angles and widths. Intensity and contrast can now be corrected, while an integral histogram allows you to optimize an image for your output device. The PKS-Write Module provides standard word processing functions plus the ability to edit layout information. The addition of Cache and Virtual Memory speeds up and extends memory-dependent functions. Create hundreds of macros, each assigned to a definable key binding which can be saved and automatically installed in each work session.

[] Open up to seven documents at a time.
[] Cut & paste to our new scrolling clipboard.
[] Create and assign master pages (style sheets).
[] Create and save text style lists.
[] Expand, compress and skew text.
[] Rotate and mirror frames, including group frames.
[] Control frame placement and size to (7) seven decimal places.
[] Print parts of pages (tiling).
[] Define more than 16 million colours and save in colour lists.
[] Set units of measurement for pages, fonts and lines.
[] Choose write modes: transparent, opaque and inverse.
[] Align frames to other frames.
[] Define vertical alignment settings.

DMC brings "WYNIWYG" (What You Need Is What You Get) to desktop publishing. The modular concept means that you purchase exactly what you need today, with the knowledge that additional modules are available when you require them. Your choice is now easier and more economical, since you will be purchasing specialized modules, rather than entire packages.

Currently, more than a dozen modules and scores of drivers are available for use with Calamus SL. We will publicize the availability of new modules, drivers and upgrades through our normal Customer

Support channels, as well as through periodic mailings to our
registered users and press releases to all serious Atari publications.

Sincerely,

Nathan Potechin - President
DMC Publishing

353. HELP with decompression wanted!

Newsgroup: comp.sys.atari.st
Date: 1994-04-07 23:23:53 UTC
From: hallvart@ifi.uio.no
Message-ID: <2o24m9$ehe@holmenkollen.ifi.uio.no>
Source record: 189628

I've been trying to decompress files using "DC Extract" which seems to work fine most of the time, but occasionaly it won't work with some software.
I got recommended to use "Lharc 2.99" and "STzip 2.4" which I've dowloaded together with a bunch of ARC and other ".TTP" programs.
I'm getting very confused as to what I need and can use. I've tried using the .TTP programs, but I've never made it work. I've tried using all sorts of different combinations of "code" to decompress files, but I just can't make anything work, so I've sort of given up the command line thing.
The .LZH and .ZIP programs seem to be taken care of with "Lharc 2.99" and "STzip 2.4", but what about .ZOO .LHA .ARC and .Z (UNIX style compress)?

I've downloaded the "Compress program" and "Gzip" too which are supposed to handle .Z files but they're both .TTP programs, and I can't find the right command to use to decompress.
I'd like to find GEM programs for the rest too, just like "DC Extract", "Lharc 2.99" and "STZip 2.4". Any suggestions to which program(s) I should use, and what to type in the command line for the .TTP programs?

My system compromises of a 520STE with 2MB RAM and TOS 2.06 I use a RAMdisk where I do the decompression. By the way, is it possible to get a RAMdisk that automatically loads up certain
programs? I have a "startup" disk with the RAMdisk, decompression software etc. and I always
have to copy over the decompression software to the RAMdisk first. Is it possible to make this
happen automatically?
Thanks.

Yes I think that Uni is part of the Old Berlin Under Ground railway, or has
water got into the cables..:-)

They must be because they are on some end of a long link of nodes...

We have that problem here...

Its a pity as its the best Archive site in Germany, and very well run...

>

In the world there are more than 3 million (!) Atari-users. That means lots of buying-power... I can't say you are wrong - but consider this anyway: in the PC -world all the software publishers have to compete very (I mean _very_) hard to get their share of the money. Why? First, there are so unbelievably many games (and other software..) existing that it's very difficult to sell enough some single game. In Atari-world, e.g MicroProse has told (in ST-Format mag.) that the ST-version of F1GP sold more than 50.000 copies. Notice: sold. I doubt they were very disappointed.. 50.000 games is much even in the PC-world!
In the same ST-Format many other sw-houses announced their ST-games selling figures. I can't remember exact numbers, but many games went well over the 30.000 point (e.g Civilization, Sensible Soccer, Dungeon Master).
I still think that it is very possible to make money with ST/Falcon-games - especially in the Europe. But these games have to be really good.

>
> After countless failures in the Atari market - many developers don't even
> bother to produce Atari stuff anymore. Could you blame them?
>
Yes, I could... Some have failed, but many have succeeded as well. One thing that software-houses have mostly not understood, is this: people don't buy quick-and-dirty, cheap conversions. Games that don't support STE, Falcon, hard-disks, etc. Well, not most of them (exception: F1GP..). Good games sell mostly well.

> 1) Atari barely supports their hardware

European market is a totally different thing.. Very often, after reading an
American Atari-mag, one feels somewhat strange. Things seem(ed) pretty gloomy
there. But take a German mag, e.g ST-Computer =-) ! Wow..! Software, hardware,
new things... Even a porn-game by Teresa Orlowski for Falcon! ;-)
Here, in Finland, Atari's situation has always been quite the same as in the
USA - that is, quite hopeless. But still, Germany is near, and there Atari
lives pretty well. Let's hope that their new 68040-TT's blow some more fire to
their professional Atari-market.

> This is not to say that the Atari market is devoid of talent - quite the

>
> I don't want to flame Atari but let's be honest with eachother and stop
> hoping for things which are unlikely to come!

It's kind of sad to hear that - because what will happen, is very strongly up
to us. If we don't believe in what we use - why should the others believe..?
One can "surrender", when the hope is lost. I don't believe that the hope is
lost at all. The PC-world will be in trouble soon, because DOS can't survive
much longer. That's what the professionals think, at least - and they should
(?) know. That means some kind of chaos, as means Apple's Power-PC circus. In
the middle of that chaos - especially, if C= dies away, as seems, there may
well be room for Atari in the computer world again. Of course, that needs new,
better computers, OS's, etc - but that's exactly what Atari-developers in
Germany, USA, France, ... are making. Medusa-040 e.g is a fine computer, don't
you agree?

> I would also like to buy some Falcon specific games!

We all want to. That's why we got to get our message through to the
game-makers.. ;-) ! They don't know we exist - but we do...!

Toad Computers is about an hour's drive (maybe a little less) from
Washington. D.C., not far from Anapolis, MD, and worth a visit if you're
an Atari aficionado and happen to be nearby...

357. Doom for Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-04-08 00:31:24 UTC
From: THIETAVUO@FINABO.ABO.FI
Message-ID: <1994Apr8.003124.25871@abo.fi>
Source record: 189632

I don't think Id Software would necessarily make a silly decision, if (and if..) they decided to make Doom for Falcon. For one thing, I want one - and so do most of us, Falcon-owners, I believe.. Who _wouldn't_ want DOOM..? ;-)
So - it might help Falcon-sales, bring money to its maker - and maybe even create some good publicity at least in the Atari-world.

To everyone saying: "To make Atari-games is to lose money.." I throw this question: why do Silmarils Software make Falcon-only games (like Ishar 1, 2, 3, and Transarctica)..? Do they lose money? I doubt that - strongly.
They just have some courage that most software-houses don't have.
Maybe Id Software is small enough to have such courage, too...
Maybe not.

Civilization for the ST became reality, thanks to all those people in G.B writing to MicroProse, telling them: "We _want_ it!". So, finally they made it - and it sold very well..! Can we learn something from that?
Maybe one thing. If we don't act together, we won't get anything.

>I have heard about some 8meg boards but they are apparently a bit of a hack and
>tend to be slower than accessing 4 or 16meg of RAM, I don't know why this should
>be. Perhaps someone has one and can comment ?

Not so. The 3rdparty boards that allow over 16MB of memory do so in
the same manner as for the TT - there is two memmory spaces - slow and fast
RAM - where the slow ram is the ram that has to contend with the video fetches
(ie the falcon ram that can only be expanded to 14MB) and the other ram space
that is only limited by the addressing hardware (4GB - 16MB - misc (I think)
). Therefore, if you got one of the 32MB memmory boards, not only would you
be able to put in an _additional_ 4MB (making 8MB) but it would be faster than
the present 4MB. The reason they are a "hack" (literally in that wires may
need to be cut/added) is because Atari did not give the Falcon a standard port
for accessing memory in the secondary memmory space, so the 3rd parties had to
find "creative" methods of getting that memmory in there.

BTW, the big chunk of those "bits and pieces" mentioned above is the
space set aside for the ROMs.

I don't know if anyone read Dave Taylor's article on the Jaguar,
but in it, he implied that he'd be using the Falcon just long enough to
port the development tools he wanted to his NeXT. PC Doom was done on
the NeXT as well.

Me, I'm waiting for Linux Doom. It's sad to say, but linux probably has
a larger installed base than the Falcon.

NeoDesk is nice, at least in comparison with the original TOS 1.0-1.62 desktop, but I don't see how it's any better than the built-in Falcon desktop... There are a few nifty things, like optimized file copying and ability to set TT RAM bits/Fastload bits in the Show Info dialog, that NewDesk doesn't have, but those are quite minor IMO. I'm forced to use it on my TT when I use Geneva (which I love & use nearly all the time), but I'd actually prefer to use the built-in TT desktop if there was such an option.

I am looking forward to NeoDesk 4 however. It should be a cut above anything else out there, especially when used with Geneva...

Source record: 189645

This one is really weird! I've been using a high speed modem for
quite a while now... and everything has gone fine.
Recently i've developed a problem. I have the modular HSModem files
Drvin & MFP in the auto folder, and ZModem has worked fine, usually
around 1400cps for archived files, 1600 for text (v.32bis/v.42bis).
Now for some reason ZModem says 1800cps and keeps on repositioning,
eventually aborting.

I tried replacing the HSModem modules with Serial Fix V2, that
made no difference. I tried running an older version of Zmodem,
and again no difference.

Anyone got any clues as to what might be going wrong?

I've got a 2Meg STE, Mono screen, GVC Fax modem, ICD Host Adaptor.

BTW: Xmodem & UUCP work fine still.

Craig.

> is limited to 2^21 sectors, which is 2^30 bytes AKA 1 GB.

This is valid when using physical sectors of 512 bytes size. Quite a
few drives can be told to use larger sectors, at least of 1024 bytes
size, so the limit increases to 2 GB. You need special driver software
for this, though. I don't know of any other driver than my own which
runs on such a configuration.

Hi,

I'd like to do some cross-compiling for the ST using a Sun. Unfortunately I don't know where to get the source of the GNU compiler for the Atari. Anyone ?

Thanks!
Ronald

Gemini is on most ftp sites. It runs on the Falcon and is MTOS and Mag!X
compatible. It doesn't work with Geneva, because Geneva messes up the
environment (at least that's what it looks like).

Yes RDE v5 which is available from atari.archive. It is very good and will
do exactly what you want and more.

} I've never seen this problem before either, with ROM TOS 4.01 or RAM TOS
} 4.04.

Thanks for everyone who's replied to me about this (some 25 or so people now),
all of you telling me you'd never seen it happen... I had to do it one more time
just to convince myself it does :-)

It appears the desktop has problems showing files when the pixel height of the
screen is not evenly divisible by 16. (This was gleaned from the BLOWUP manual).
Of course I was running on a TV (res = 320x200) so I was bitten...

Amazing (NOT!!) that *everyone* with a Falcon seems to have a monitor. I suppose
this is a good sign. I've just got myself a 15" SVGA, and I'm now much happier
with the performance.

Roll 0n the '040 card with fast mem and a PCI video slot, that's what I say!

379. Games to clean out of my garage

Newsgroup: comp.sys.atari.st
Date: 1994-04-08 13:13:19 UTC
From: "Randall G. McKee" <mckeerg@Texaco.com>
Message-ID: <1994Apr8.131319.7690@texhrc.uucp>
Source record: 189552

I had a friend give me an Atari ST 1040, but it had a flaky power supply and I finally gave up on it and gave it away. However, I kept the games because I had some vague hope I could figure out a way to play Leisure Suit Larry and Zack McKracken on my Mac LC III.

Well, I don't know of a way (does anyone out there?) So, I have this box of 53 or so games in my garage that my wife would dearly like me to dispose of. Anyone want them? What are they worth to you. I have all the original boxes (albeit some of them
are a bit smooshed by my kids), but to the best of my knowledge all the games work
and all the disks, manuals, whatever are there.

I'm really not looking to sell these one at a time or make a lot of money here - so
someone make me an offer if you want these games. I was thinking of asking $100 and I'd cover shipping and packaging (less than $2 a game), but I'm willing to negotiate. The important thing is to get them out of my garage and into the hands of someone who might use them. I'm just not willing to lose money on this deal.

Of course, if there's a way to run them on the Mac LC III, maybe I'll sneak Zack McKracken out of the box!

Anyway, here's a list - let me know if you're interested:

Sierra Police Quest 2 - The Vengeance
Broderbund Sim City
Sierra Manhunter - New York
LucasFilm Zack McKracken and the Alien Mindbenders
Epyx Dive Bomber
Electronic Arts Populous
Rainbird Carrier Command
First Row Prime Time - TV Network Game

Tommi:

To some extent I agree with you. Most of what I said concerning the Atari market was in reference to the dismal situation in the US, where I have some personal experience in commercial software development (namely games).

Yes, I have heard numerous quotes that there are approx. 2-3 million ST's in Europe. However, a substantial number of these machines are "low end" systems (i.e. floppy based, 512kb STFs, STFMs, and STes). Given the advances in game development - these systems make it rather difficult for major developers to port versions of their software over to the ST as they will usually have to make too many compromises.

Unlike PC clone makers, Atari rested on its laurels too long and made ST system upgrades like RAM and HD expansion difficult until the STe/TT series.

I also agree with you that there have been some simply aweful game ports to the ST - these were so bad that the companies that released these products often experienced poor/slow sales. Does anybody remember the ST version of the following:

Outrun
Tetris
Jet
Wizball
1943

The list can go on...

Sure, if you release crappy software then you should expect to suffer poor sales!

However, remember this - the average PC game will sell 10,000 copies (even if itsucks) while in the US, an ST game is lucky to sell 200 copies and in Europe maybe 2,000-3,000.

Again, I make my point that many developers are put off by the fact that they can make substantially more money doing PC and MAC versions of their software. Also, game development is cheaper as the same basic VGA game for a PC can be ported with little problem to a color MAC or a 5/6/or 8bit planed Amiga system. The graphics will port clean while on the ST you have tomake alot of changes.

Then, you have to consider the distrubtion centers available to the platform. PCs and MACs are sold everywhere. Ataris are not. Any place that sells PC or Mac books, accessories, and hardware will also sell the software.

And, again, as Atari won't supply actual hardware sales figures, it makes the task of projecting sales for the average developer very hard. Just becauser

there are 3 million ST owners doesn't mean that 3 million people will buy a game. There are consumer trends involved that are far easier to obtain on the PC and Mac market then on the Atari market.

After all of this, this is not to say that an Atari developer can't make money as there are several that still do. However, you will notice the general shift in the Aatri market from games to application and utility development by many developers.

And, finally, on top of al of this - Atari itself has more or less dropped the computer line! Many developers won't even consider supporting a machine if they think it will be orphaned. Orphaned machines don't sell and often the cost of maintaining the investment is outweighed by the atteactivenss of newer, cheaper, and better supported systems.

Now, technologically - especially the TT and Falcon - Atari machines are often technologically superior tot heir PC and Mac counterparts. They are inherently better suited for games right out of the box with their hardware scrolling, local bus video, and sound hardware, etc. Unfortunately, innovation and technical superiority never was a guarentee for success - marketing, advertising, support, and captial are. If you don't believe just look how Windows became a defacto OS and the longevity of the Apple II family.

I think I've made my point clear...

Another alternative would be to replace all the keyswitches with
Cherry keyswitches. They are higher quality and produce a firmer
tactile feel. If you've ever used a Wyse terminal, the keyswitches in
the keyboard are Cherry.

On an 8mHz ST, I was getting about 1600 CPS for archived files, using
hsmoda02, Uniterm, and GSZRZ 2.28. Connect's internal Zmodem gave me
about the same performance. So, I suggest you try GSZRZ 2.28. It is
much nicer and faster than xzy.ttp (if that is what you are using).

> I tried replacing the HSModem modules with Serial Fix V2, that
> made no difference. I tried running an older version of Zmodem,
> and again no difference.

Serial Fix is slower than hsmoda02, but it should work as well. Do you
have a long modem cable? Have you moved your cables around recently?
I once had a weird problem go away when I shuffled cables around (probably
had a serial line parallel to a power cable, so noise jumped from one to
the other). Try to get as short an RS232 cable as possible.

> I've got a 2Meg STE, Mono screen, GVC Fax modem, ICD Host Adaptor.

Can the Falcon handle Doom? I have heard some people question this. I would be quite happy with a perfect conversion of Wolfenstein 3D for the Falcon. I think that that would be very possible. Does anyone know ID's e-mail address? Let's bombard them with requests to release a game for the Falcon. They have a Falcon for Jag development and if they could port Wolf 3D for the Jag in "15 CDs" then they could probably port it to the Falcon.

These programs are historically part of the UNIX UUCP package. They are designed to allow reliable transfer of binary files via email. IBM mail gateways use the EBCDIC (sp?) character standard, everything else uses ASCII. There is no proper mapping between the two for non-visible characters. Thus, if a file contained binary data (which could easily be equivalent to non-visible characters), it would be corrupted when going through such a gateway. UUencoding solves this by encoding a binary file using only visible characters. The file is typically a bit larger after this occurs, but will survive being email'ed through weird machines. As they are just plain text files, you can also cut them up into pieced and pasted them together with a simple text editor (handy for big files that won't fit on a single floppy, if a bit cumbersome).

You can find Atari versions of uuencode/uudecode on atari.archive.umich.edu. Also, any UNIX machine should have these utilities.

Yes, there is a small user base for the Falcon right now. But ID
did commit to taking on the Jaguar project before the Jag was even
shipping! ID pretty much said that they wanted to do it for fun.
Maybe they'll port it to the Falcon for fun :-). Besides, although
the money that can be made in the Falcon is less than on the PC
(quite obviously) ID would certainly make money on it. After all
Doom is shareware so there is certainly not too much risk in it.
The worst case scenario: they waste their time....

>option...
There are many things that make NeoDesk better than the Falcon
desktop (NewDesk). It's so much quicker/better to move and copy files; to get
to the directory of one of your program icons; to set up environment
variables; to edit icons; to reorder directories; to duplicate a directory
window; to split a directory window; etc; etc.

Two things are prefer about NewDesk: Icons can be more than two colours.
This makes them much prettier, but, of course, does not affect functionality.
You need NewDesk to change screen resolution, there is no such option in
NeoDesk.

NewDesk is a reasonable attempt at copying NeoDesk2, but NeoDesk has moved
a long way since then...

From: David L Watson <dw4g+@andrew.cmu.edu>
Message-ID: <YhdOZdC00VoqEC=UQn@andrew.cmu.edu>
Source record: 189569

I want to set up Mint/Minix on my TT (Tos 2.06). I was planning to set up the Minix file system on a 54M partition. I wanted to start everything up using the Mint Distribution Kit from a.a. but it doesn't seem to have the latest version of Minix that supports the larger partition size. What would be the best way for me to install the system? In case it matters, I'm using AHDI 5.0.

I bought Rainbow 0.5, got a free upgrade to V1.0 and registred it to get a free upgrade to V2.0 :-)

I agree it is a superb program and they are even promising Multimedia abilities such as graphichs and sound for V2.0 :)

I can give you (and all other interested) the phonenumber and adress to the Swedish (and only) distributor:

C-TEK
BOX 2056
280 20 VITTSJO (SWEDEN)

TEL/FAX (& Swedish answermachine) +46-451-24088

I dont think they are on the net (yet).

BTW the price for Rainbow is 395Skr = about 50US$

Very easy to understand, whether true or not. Falcon can't rival NeXT as a developing machine, nor can PC or Mac.

> Why wast money on a Game that will not be sold, you need machines to run it on,
> there only a Few Falcons out there...

Maybe _there_ - not here... In my country, Atari has always been a minor player - and well hated by the media... ;-(Still, Falcon-sales have really risen due to new, lower prices. The result is following: I can quickly count 10 Falcons, 5 Mega-ST's, 4 ST's, 3 TT's, 1 Mega-STE and 1 STE, owned by people I know. So - here, in my neighbourhood, the bird is clearly the most common Atari.
And more and more people are planning to buy one...
In Finland, that's not just strange - it's sensational.
The same might happen anywhere - in the U.S.A too.

> If you don't sell machines you will not get Games for it, also the Falcon
> is way way over Priced...

I agree on that.

> The PC is the only way to go, Fact not fiction....

If I had wanted a PC - I would have bought one. That's simple.
There's one thing wondering me all the time.. For some people it seems all the same, what computer one has - what is the OS, and so on.. Those people seem to buy only computers that are common enough, cheap enough, and generally accepted. Would you buy any car - that is "standard", common, etc..?
Why on Earth should _any_ Atarian change to a DOS-machine just because some other people have done so..? This may sound rather proud, but think about it: a computer is always your _personal_ tool. You work with it - and it's never sensible to work with tools that don't please you. I believe Atari is very strongly an alternative to PC's or Macs - and many of us, including me, use it because it feels "good" in our hands. Some things have that "something" !
IF - and if - we really "surrendered", and learned to think that: "O.K - world is not fair, DOS/Windoze rules, maybe even The Great Pumpkin exists.." - then we might as well all use Toyota cars (no insult!), drink Coke, and use similar clothes. There _may_ not be room for really personal computers like Atari these

days, because that damned "business" makes it impossible. But we don't have to accept is, do we? As long as me, and 3 million other "fools" use and buy Atari computer's - well... There is, and will be a market, money, everything.
It's up to us.

> Atari have stated that they have droped out of Computers...!!

When? A short time ago, they officially announced that Atari _will_ be in computer business also in the future.

> Try and live in the Real world, go buy a PC clone.....

If I had some masochistic tendencies... Maybe ;-) ! But no, thanks.
If that "real world" means Dos, Windows and such things - I'd rather live in my nice, little, very unreal Atari-world..! =-)
World needs different thoughts, and different kinds of computers - don't you agree..? I can do business with PC's at work - but when I come home, it's nice to have something friendly - like Falcon - on my desk.

Many people will never understand what I mean - but I believe, many of you do.

RT> switch between the upper/lower 4 Mb depending on what address (even
RT> longwords?) which
RT> is accessed.

Ummmm.....first question that comes to mind is:

Where would you put 8 SIMMs? The current design BARELY has room to accomodate 4 SIMMS, and if you require that people remove their internal drive to install the board, then VERY few people will buy it.

Second question is:

Will the system even allow you to run 8 meg? If you configure to 4 meg and try to access memory beyond that, the system bus errors. If you configure to 16 meg, then the system may not come up at all, or worse, may try to use memory that doesn't exist. Don't forget that the memory restrictions are imposed by the Falcon hardware itself, NOT the RAM Gizmo, or any of the derivative products on the market from other companies, such as the Falcon Wing.

Later,
Gizmo

Take WinRec to produce the samples and WinCut to put them together as you
want, and play around with all kinds of DSP effects in realtime. Both
programs are available as Shareware and soon in an enhanced commercial
version.

Yes. Atari's MetaDOS drivers do not support drives connected to the ACSI port, and MetaDOS won't work properly with MiNT. For a solution for the first problem, you'll probably have to get a third-party driver (ICD's or Hard&Soft's come to mind).

Just a silly thought... you are looking for stereo sound, are the
connections (adaptors) stereo? Some microphone jacks are mono, so
if your RCA connectors are going into a mono headphone jack, there will
be no stereo. I ran my old 520STe through a box that had RCA inputs
for a 'line in'. Other than that, running the line into the microphone
jack may not be a good idea it is not really designed for input to
the speakers like this.

My TT030 has a pair of active speakers hooked up to it from the same
RCA connectors as the STe... sounds GREAT!

Back when Atari Explorer was a print magazine, I filled in for
Atari as a rep on Delphi. I still have the ear of people over there,
and while I do not get paid, I have free accounts on GEnie and Delphi
in order to answer questions for the people there.

Call Atari at 1-408-745-2000 That is the front desk, and from there
you can get wherever you need to. Hey... Atari still has help for
the 2600 online there, so go to it!

Don Thomas is the head of the group over there, and they have some
of the old hands there as well as some great new people working there.

In a previous article, entropy@gnu.ai.mit.edu (maximum entropy) says:
+In article <CnrxEF.Kyw@freenet.carleton.ca> am136@FreeNet.Carleton.CA (Stephen Mulrine)
writes:
+>The only way around this seems to be to cross-compile on a platform without
+>the 8+3 filename limit, or to indulge in some major hacking (renaming files,
+>changing source code, and taking a binary editor to the resultant library).
+You need to build the library either on a properly configured minixfs
+setup (while running MiNT) or on a TOS filesystem using UNIXMODE. See
+UNIXMODE.DOC in the library source distribution.

Found it, although it's a bit short on examples. setenv UNIXMODE "/._LAdrD"
seems to set things up the way I want them (after a bit of trial and error).

+Be forewarned that there's an error in JRB's last update, that will
+cause the make process to destroy 2 source files. The version I'll
+post soon has a correctred 'mincl' that won't do that.

That explains why only the source appeared and never any actual binaries..

Thanks,
Stephen

>M-TOS is essentially for! :)

I think you missed something... He's not talking about the complete Minix
operating system, just the Minix filesystem. You can use a Minix filesystem
driver with MiNT/MultiTOS and all file accesses to the MinixFS drives will
be several times faster than to regular TOS FS drives. Regular GEM apps can
be installed on MinixFS partitions and run just fine under MultiTOS.

Or did *I* miss the point you were trying to make? (What a confusing thread...)

You could try using the 'Revenge Doc Displayer' (RDD3) it should be on
atari.archive.umich.edu by now (RDD320.ZIP).... but then again I would
say that 'cause I wrote it...! It works well with Terradesk, I use it
with 1.36 and experience no problems.

Regards,

Stu...!

Apparantly (or so someone posted a few weeks back) Atari reckon all of the STEs with the dodgy DMA chip have been repaired, so it's very unlikely that you have one. Mind you that might just have applied to the UK...

I was looking for Empire II as well a few years ago. Frankly, Civilisation is so much like Empire in terms of combat, military units, fog of war, provides far more variety of play, that one could consider it a re-vamped Empire. It is so similar I'm suprised that there was no "patrol" or "wander" commands in Civ.

> common policy just to ignore all Atari computer user's needs..? I've been
> wondering, whether the Amoeba-users are more clever than us - by making more
> NOISE about what they want..?

1) The Falcon doesn't have enough CPU power to do it well, even if they
use the DSP for something.

2) They hate the Falcon development environment. DOOM was developed
under NEXTSTEP, so I can see their point. The posts I've seen from
the id Software developer working on the Jaguar port have been
gushing about how neat the Jag is, and how much the Falcon stinks,
and how he wants to port the Jag development tools to NEXTSTEP as
soon as possible (which IMHO would be awesome, since that would
instantly become the 2nd Jaguar development platform).

3) Very, very few Falcons have been sold.

There is a program _like_ DOOM being developed specifically for the
Falcon, it's called "Of Lasers and Men", and from he posts I've seen,
it's quite good. I've got an ST though, so download it yourself and
see!

420. popup menus

Newsgroup: comp.sys.atari.st
Date: 1994-04-09 14:19:38 UTC
From: llunch@knuth.cba.csuohio.edu
Message-ID: <1994Apr9.141938.9524@news.csuohio.edu>
Source record: 189595

Looking at gemlib's prototypes for the new aes menu calls, I
can make some guesses as to how they work, but I still have questions:
__EXTERN int menu_attach __PROTO((int me_flag, OBJECT *me_tree, int me_item,
MENU_T *me_mdata));
So, me_item is the index of the object in me_tree that this
submenu will be associated with. the aes will do
me_tree[me_item].ob_flags|=SUBMENU, and me_mdata is saved in some
structer that can be found when me_tree and me_item are known. A
submenu can be attachted to any object. Does anything happen if a
submenu is attachted to a dialog button and the user pushes that
button? gemfast.h does not contain any defines for me_flag. What are
they?

__EXTERN int menu_istart __PROTO((int me_flag, OBJECT *me_tree,
int me_imenu, int me_item));
Here are the tree and index of the object associated with the
submenu, plus the index of the starting object within the submenu. If
I had to guess, I would say that me_item is the starting object.

__EXTERN int menu_settings __PROTO((int me_flag, MN_SET *me_values));
So, an application can only have 1 set of settings, rather
than doing it on a per menu basis.

Is there any freely avaiable library that has bindings and
defines for all the aes 3.3 and multitos calls?

thanks,
Jason

You're making one very wrong assumption; that IBM's PowerPC-based
desktop machines will be just DOS clones with a different CPU.

PowerPC is seen as a fresh start for the PC (ie personal computer, not
IBM PC) community; IBM's desktop machines will use PCMCIA as their bus
architecture, others will use PCI (an architecture that goes at the
speed of your CPU/motherboard, and is 32- or 64-bits wide).

Stu, any chance that in the next revision you could do a bit of work on
the scrolling options menu. I for one think the command grouping could
be improved a little. Things like having all the Save options together,
maybe splitting direct operational commands out, and having the things
listed in alphabetical order?

Message-ID: <01HAYZDDS8JM8WX13T@SNYONEVA.CC.ONEONTA.EDU>
Source record: 189501

Hi all.

I do contract graphics work for games and the like and I'm curious about what Falcon specific (and compatible) art/painting packages are currently available.

I know about Prism Paint 2 and I am strongly considering it for my purposes. But, I would like to know about others that might fit my needs.

Please note: I have no need for animation and high-end touch-up packages (yet). Rather, I'm interested in straight forward graphics packages in the class of Deluxe Paint and True paint,etc.

Basically, I would like the graphics package to support the following:

* GIF, IFF/LBM, PCX, TIFF image import/export
* 16, 256, and TC modes (if possible)
* Support 320x200, 640x200, VGA res, etc but not require a VGA monitor!
* Multiple screen buffers
* Multiple zoom modes
* Extensive Block manipulations
* Undoable UNDO
* Palette blending
* Special brush effects (smearing, tinting, bluring, anti-alias, etc.)
* To cost under $100 US if possible! (I'm not rich!)

DOes anybody know of such a beast? Whatever happened to all of those paint packages promised in the Atari Falcon Developer's literature?

What's the status of:

Chranach Paint
Eclipse Paint
Merridean
Chagall
Synthetic Arts

Currently, I use Deluxe Paint and True Paint and I need more power! I know about GEMVIEW for file conversions but I'd also like a more stream-lined process (to be able to save a file directly in the format I need, etc.)

Thanks for any and all help!!!

Ari

No I haven't read his article. I'm just going on personal experience as a
registered Atari TOS developer and a registered Atari Jaguar Developer.
And from a programers point of view the Jaguar has a lot of the tools I'm used
to using. Both development tools and how the hardware actually works.

>but in it, he implied that he'd be using the Falcon just long enough to

I did read in one mag how they expect Atari to ship over 500,000 Jag's and that was why they went with it over the 3do.

And if the game is as good as the screen shots I've seen, I can imagine an awful lot of people who got addicted to it on a Dos box going out and getting a Jag just to run it.

I think the best hope to getting Doom on the Falcon would be to (a) find a programming team with the time and inclination and (b) start a campaign to raise the money to liscense the Falcon port from id. There is going to be a 3do version done by someone that paid for the right to do it so maybe they would take pity on us and let someone do it for a small price.

> -scott tirrell

I think it can. Haven't you seen that Wolfenstein-clone "Lasers & Men" from France..? It uses DSP, 16-bit sound, and Falcon True Color (16-bit) mode..! And works very well, I think! All Falcon-users should immediately download it (it's shareware), to judge it themselves. I think it could be found from cnam.cnam.fr (if I don't remember that wrong..). Great place that, anyway! Your idea about "attacking" Id with Atari-ideas is a _good_ one! Let's try it, if somebody works out their address.

I'n pretty certain that Doom _can_ be ported to Falcon. The problems are elsewhere. Mostly in peoples (including us?) attitudes: "it can't be done..".

Not necessarily! Falcon has a fast Blitter, DSP, and quite enough power to match a 486-33 (at least, so have some programmers from England claimed..) when we speak about games. Wolfenstein-3D clone "Lasers & Men" runs in 65.000 color mode on Falcon, uses DSP - and works very well..!

>] And... Where is MP Formula One Grand Prix for Falcon..? They could convert

> Would that be the one that's been available on the st for over 2 years?

Exactly that. I may be a Formula-freak ;-) - but that game is something almost worth dying.. And how easy it'd be to get those 256-color PC-graphics to Falcon, even if they didn't bother using the DSP, or Blitter at all..!
I will personally be very disappointed, if MicroProse won't convert their best game for Falcon. And I think I'm not alone with these thoughts.. ;-) !

Hmmm... but just cos they wrote it under NeXTstep doesn't mean it was written to be run under NeXTstep. My guess is they used NeXTstep cos it's a neat environment but used a cross compiler to get the PC code...

Still I hope you're right and that it _did_ originally run on 68030+56001...

Gee, it's kinda nice to see that .de users have this problem too...

Here I was beginning to think that the entire *.de domain was connected to
the world by a sole 1200baud modem..

My average FTP data retrievel rate from any german ftp site is around the 300
to 600 baud mark.

:)

Help..

DUPLICATE FILES....

Is there a program for finding Duplicate files..??

I have one DUPFIND but its Buged..

I need to tidy up my hard drive, and I have to many copies of things
lying around....

DUPFIND could do the job but it comes up with a error after some time..

Thanks....

April 16, 1994

M a s t e r B r o w s e 4 . 0
"""""""""""""""""""""""""""""""

Copyright 1993, 1994, Michel Forget
Electric Storm Software

There is a new version of MasterBrowse available!

Using FTP, you can get the new version of MasterBrowse (when it is validated) from either of the following addresses:

atari.archive.umich.edu (/atari/Newitems/mb40_bin.lzh)
ftp.tu-clausthal.de (/pub/atari/Newitems/mb40_bin.lzh)

Both of the FTP sites mentioned above can be accessed using a mail server, for those who do not have FTP access. The file will also appear soon (with the name MB40_BIN.LZH) on GEnie, Delphi, and CompuServe. In addition, the new version of MasterBrowse has been submitted to comp.binaries.atari.st for distribution.

For those who have never used MasterBrowse before, a detailed description of the program will follow the list of new features and bug fixes.

~ ~

The new version of MasterBrowse was compiled with Sozobon C 2.00 (extended by Jerry G. Geiger). This results in a smaller executable, which operates faster and uses far less memory than previous versions of MasterBrowse.

BUG FIX: MasterBrowse now handles TAB expansion correctly.

NEW FEATURE: MasterBrowse now allows wildcards in search strings. The following UNIX wildcard characters are accepted:

[] - Entering "b[ai]rd" would cause MasterBrowse to stop searching on the strings "bard" and "bird".

Entering "[a-h]og" would cause MasterBrowse to stop searching on the strings "bog", "dog", "fog", and "hog". MasterBrowse would not stop searching on "log", though, because the first letter of that word is not within the accepted range.

* - Entering "work*" would cause MasterBrowse to stop searching on the strings "work", "worker", "working", "worked", and others.

? - Entering "wor?" would cause MasterBrowse to stop
searching on the strings "word", "work", "worm", and
others.

! - This is the refusal operator! Entering "[!a-k]og" would
cause MasterBrowse to stop searching on the word "log",
but ignore the words "bog", "dog", "fog", and "hog".

NEW FEATURE: MasterBrowse now uses round radio buttons and checkboxes with
crosses.

BUG FIX: MasterBrowse will no longer crash while printing. (This only
happened in certain situations.)

REMOVAL: In an effort to reduce the size of MasterBrowse, the use of
compressed text files is no longer supported; this reduces
the overall size of MasterBrowse 17K and reduces memory
consumption by 92K (most of which is due to the new
compiler).

NEW FEATURE: The "Save Options", "Save Options As...", and "Load Options..."
options are no longer found in the varous "options" dialog
boxes. They are now menu entries found under the "Window"
menu.

BUG FIX: MasterBrowse will no longer cause problems if your colour
index settings are higher than the maximum number of colours
available in the current resolution. If this happens,
MasterBrowse will simply use default colours.

NEW FEATURE: MasterBrowse now allows you to control dialog boxes with the
keyboard; hold down the Alternate key and press the key
corresponding to the underlined letter in the button you want
to select.

BUG FIX: MasterBrowse will no longer crash if you select "Save Document
Batch..." while progress displays are enabled.

BUG FIX: MasterBrowse will no longer skip files when saving a document
batch. (This only happened if the document batch contained
two files.)

BUG FIX: MasterBrowse now handles iconification in medium resolution
correctly.

~ ~

Everyone who owns a computer has, at one time or another, needed
to view the contents of a text file. The text file viewer supplied
with Atari computers will allow you to do this, but it is lacking in
many respects.

MasterBrowse is a replacement text file viewer for any Atari computer,
in any resolution except low (though this restriction is not enforced). It
offers many features that the Atari text file viewer does not:

o MasterBrowse has a friendly, easy-to-use, 100% GEM automated installation program.

o MasterBrowse has an extremely fast GEM user interface, which makes use of raster copy screen updates, GDOS/SpeedoGDOS fonts, pull-down menus, windows, windowed dialog boxes, colour, round radio buttons, checkboxes, keyboard shortcuts in dialog boxes, and more.

o MasterBrowse works with MultiTOS, MultiGEM, Mag!X, and Geneva. With MultiTOS or Geneva, MasterBrowse can ensure that only one copy of MasterBrowse is in memory at a time. If another copy of MasterBrowse is launched, the copy of MasterBrowse already in memory will be instructed to display the files. The utility that makes this possible (the "client-program") can be configured to call an alternate viewer for special types of files, such as pictures or sound files.

MasterBrowse also understands the MultiTOS Drag & Drop Protocol.

With Mag!X, MasterBrowse can communicate with the desktop to ensure that only one copy of MasterBrowse is in memory at a time, as with Geneva and MultiTOS.

o MasterBrowse can use the command line to open documents (or to open a document batch). The ARGV, xArg, and standard command line formats are supported.

o MasterBrowse supports the View Protocol, by Peter Seitz, which allows other programs to instruct MasterBrowse to display a file instead of using their own default viewers. Currently, the following programs support (or soon will support) the View Protocol: STZip, Lharc Shell, ShowImage, GemView, and DiskList.

o MasterBrowse allows you to have a virtually unlimited number of documents open at the same time, restricted only by the number of available windows and the amount of free memory.

o MasterBrowse provides keyboard shortcuts for every menu entry. If you do not like the default keyboard shortcuts for menu entries, you can change them to suit your needs!

o MasterBrowse provides you with a Quick Document Access feature found in no other program. With this feature, you can instantly load any of the last seven files that have been opened (in case you need a document again after closing it).

o MasterBrowse allows you to (optionally) save your configuration automatically when you exit the program, or even save a document batch that will automatically be loaded the next time you use MasterBrowse.

o MasterBrowse allows you to use all of your familiar movement keys. You can use the arrow keys, the application keypad, or even the space bar and the return key.

o MasterBrowse allows you to move in any direction inside a
document, as you would expect. What you might not expect is that
you can tell MasterBrowse how far it should move when the movement
keys are pressed. How about moving two lines down instead of one?
Or perhaps three lines suits you better?

Do you still want more power? Keep reading.

-You can jump to a specific line, a specific page, the start of
a block, the end of a block, or any of ten personal "bookmarks"
that MasterBrowse supplies for each text window.

o MasterBrowse allows you to move through a document (by lines or pages)
using a special Quick Scroll Mode. It uses the shift, control, and
alternate keys so that the scrolling speed is not limited by the key
repeat rate.

o MasterBrowse offers unparalled power when it comes to searching!

In addition to the ability to search for up to three strings at
the same time, starting at the top of the document or at the
current position within the document, MasterBrowse allows the
use of Unix (TM) regular expression matching (wildcards).

A search may be conducted in reverse mode or forward mode. If you
desire, you can specify which of the three search strings will be
case sensitive and which will not.

o MasterBrowse also has powerful block operations. You can mark a
block and then save it to disk, print it, or write it to the
clipboard. You can control how the block is marked on the
screen. MasterBrowse can also be configured to remove the block
markers after a block operation is completed or to leave the
markers unchanged. Blocks are marked using the -MOUSE-, exactly
as they are marked with text editors. More? A block can even be
extracted from a larger document and placed inside a MasterBrowse
window with a single keypress! In addition, MasterBrowse can append
blocks (or entire documents) to already existing files.

o MasterBrowse is a master printer. It can print a document (or a
block) with page headings, page numbers, line numbers, a description
of the file or block, a synopsis, or any combination of the five.
MasterBrowse can even print an identification string for those
people who share a printer between more than one computer. You can
also save a block or an entire document to disk (or the clipboard),
with all of the same options available. MasterBrowse can even be
configured to use the special features of your printer, such as
bolding, italics, underlining, colour, and specialized fonts.

You want even more power? MasterBrowse can print on both sides of
the printer page, and indent your text.

o MasterBrowse gives you complete control over your windows. You
can cycle through them, change their titles, shrink them, close

one, close them all, or get information about them all using the keyboard (or the mouse). MasterBrowse also allows you to remove the vertical window scroll bar, the horizontal window scroll bar, or both scroll bars (since a window that has no scroll bars can scroll more than twice as fast as a window that does have scroll bars). In addition, each MasterBrowse window can have different scroll bar settings. The size of a window can be changed by clicking in the bottom right-hand corner of the window, even if the window does not have a "sizer" gadget.

o MasterBrowse supports batch files! If you use a certain group of documents often, just load them up and tell MasterBrowse to create a batch file. One double-click on the batch file, and they will all be loaded again.

o MasterBrowse saves the positions of the first seven windows (if you want it to), so you have complete control over where your documents appear and how your screen looks.

o MasterBrowse allows you to load and save bookmark lists.

o Every window has a set of block markers and a set of ten bookmarks to itself.

o MasterBrowse also has support for the clipboard! A block can be written to the clipboard (with or without formatting) or the clipboard can be read into a MasterBrowse window.

The features listed above -barely- scratch the surface of MasterBrowse!

[> MAC owners for a start just aren't going to be bothered.

I thought that any computer that had OMEN could use any application
written for OMEN, so long as the source code was available. This is
somewhat like Unix.

Is this wrong?

There were no Faulty DMA Chips, the Chips that caused a problem are the same
that is fitted to a ST and Mega, but there was a problem, these DMA chips
did not like the new PCB lay out of the STE, it was noise that caused
the Problem...

I don't think there was ever any serial numbers, just the DMA chip part
number..

If your chip has C025913-38 then you have problems....

I did get 6 DMA chips from Atari OZZ for FREE, with C398739-001A as the part
number....

I have also seen other part numbers for DMA chips....

As a former Atari dealer, I can tell you that Atari Canada never issued any type of recall and never even notified me there was a problem. When clients added hard drives they noticed the problem - then I had the aggrivation of dealing with Atari to get parts. The hardest part of selling Atari stuff was having to deal with Atari (both Atari Canada and Atari USA). Have never dealt with such user-unfriendly staff in my whole career as a re-seller.

Finally gave up trying to run a SLM laser off of an STE. With the new DMA chips the laser did not work at all and with the old chips there was noise and what appeared as faint shadowing of printouts. Eventually returned to my MegaST-SLM combo and totally gave up using the STE with the SLM laser.

Ur, you're putting your STe's input through a mike socket? I think that's
asking for trouble! It should really go in through a DIN socket pair same
as the CD player or (possibly) record deck. (LINE IN and such). If you
put the sound though the MIC socket the hifi will probably do auto record level
adjusing and all sorts of things will happen....

I might be wrong...

Regards

David.

Really Dave, you should know better! The phone input for the record deck will have equalisation to compensate for the weird response on cartiridges. RIAA or something like that... Best bet is slap it in the AUX or CD input ar get some nice little active speakers for it...

451. New Atari Magazine!

Newsgroup: comp.sys.atari.st
Date: 1994-04-10 15:06:53 UTC
From: pdirect@news.delphi.com
Message-ID: <2o94md$bq0@news.delphi.com>
Source record: 189526

Being my first USENET posting, I'm not terribly certain of the rules regarding product announcements...however since this is probably of interest to many readers out there, I've decided to risk it. <grin>

This is the ASCII version of our announcement that TWP's new magazine is now available. It is fairly short although it contains quite a bit of information about the magazine.

If things like this aren't supposed to be put here, please email me as such and I will not do so in the future.

-BEGIN------------

PROCESSOR DIRECT IS HERE!

Public Announcement
on April 5, 1994
by Two Worlds Publishing

We're here! Two Worlds Publishing is proud to present to the Atari community our first issue, containing articles by a variety of authors on a wide array of topics from telecommunications to programming, and much more.

__
/_/ Just what is Processor Direct?
`-`------------------------------
Processor Direct is a magazine for nearly all Atari computer users, containing information valuable to users of the original 520ST up to users of the Falcon030. Processor Direct is also helpful to the new user or even the seasoned expert -- odds are most everyone will find the information they've been looking for.

We currently print in a large format (page size is 11.5 inches wide by 13.5 inches tall) with full color covers and black and white internal pages. Each issue's cover is printed on 80 pound gloss paper, with the internal pages on quality 80 pound matte paper.

__
/_/ What is in Processor Direct?
`-`----------------------------
We offer a variety of columns on topics including Graphics, Music, and Programming, along with reviews of hardware and software of both commercial and shareware nature. We've also got the latest news items on topics like new software and hardware in the Newswire and Recent Developments sections.

In the first issue we also have a survey which asks a variety of questions so we can get to know our readers better. The survey itself is 8.5x11 inches so it can be easily photocopied and mailed to us.

__
/_/ What won't I find in Processor Direct?
`-`--------------------------------------
You won't find long boring articles on topics that no one cares about, and you also won't get page upon page of unbroken dull text on cheap newsprint paper. You're going to be stuck with interesting articles printed on quality paper...we're terribly sorry! <grin>

__
/_/ Why not just read messages on-line?
`-`----------------------------------
Reading messages from USENET newsgroups and from the national on-line services is incredibly time consuming, often costly, and some times the accuracy of the information in the form of news can be doubtful. These networks are excellent to find the answers to your questions and to talk to knowledgeable people, but if you've ever read any of the USENET newsgroups, you know that contradictions and rumor run rampant. We obtain our news directly from the source, with no one to interpret or twist it. Not to mention, with each information packed issue (at only $3.50) you get easy to understand information that would normally take hours to read and compile from one day, forget a whole month.

__
/_/ When and where can I get my copy?
`-`---------------------------------
Processor Direct is available now for direct order for $3.50 ($4.00 in Canada) each from TWP, and also through a variety of Atari dealers. You can also subscribe to Processor Direct for just $25.00 (US$33 in Canada) for 12 issues.

__
/_/ Dealers: Want to carry Processor Direct?
`-`---------------------------------------
If you are a dealer and would like to obtain copies for newsstand sales, just contact us and request information.

__
/_/ How can I advertise in Processor Direct?
`-`---------------------------------------
We have advertising in a wide variety of sizes, with the option of creating your own custom sizes. Effective for both shareware and commercial developers (as well as dealers and many others) Processor Direct may be one of the best ways to tell the community about your product! For more information, contact us and request our Media Package, which contains the guidelines as well as hints and tips on making your ad look best.

__
/_/ Want to be published?

`-`----------------------
Are you an aspiring writer? Always wanted to be published? Here is your chance! Whether you are a seasoned veteran writer with years of experience or just enjoy it as a hobby, we're always looking for new articles on fresh topics and interesting viewpoints. If you'd like to know more, contact us and request our Submission Guidelines Booklet.

__
/_/ On-line and ready to serve you!
`-`--------------------------------
If you are a member of an on-line service we are incredibly easy to contact. We have accounts on GEnie and Delphi, as well as two Internet addresses. If you have a few questions, or just want to say hello, drop us a message! Have a question about an article? We'll forward your mail directly to the writer. Also "Letters to the Editor" can be mailed electronically.

__
/_/ For more info:
`-`---------------
If you've got questions or want more information, just contact us via one of the addresses below.

US Mail:
Two Worlds Publishing
3837 Northdale Blvd. #225
Tampa, FL 33624

E-Mail:
GEnie: P-DIRECT (P-DIRECT2 for article submissions)
Delphi: pdirect
Internet: p-direct@genie.geis.com
pdirect@delphi.com

The Media Package and Submissions Guidelines Booklet are provided free of charge, and will be mailed when completed.

It shouldn't be difficult to port Doom to the Falcon, if you're willing to play it in 8bit (256colours) and 320x200 mode (Heck, I don't mind it in this mode, I play it everyday like this!! :) "Of Lasers and Men" is a great game, but a _little_ slow...but that's cause it's running in a 16bit colour mode! (At least I think so!) Which is probably how the Jag version is also going to be in... IMHO, Id could make a killing if they released Doom on the Falcon scene... I mean, with all us rabid-starved-for-games users, who _wouldn't_ buy it??! :) :)

BTW, you might want to mail the chief executive officer of Id:
Jay@idsoftware.com
BUT! I STRONGLY recommend that we all put our names on a list and sending him the list with an attached message, rather than mailing him one by one and pissing him off. I don't want this idea to die before it even has a chance to come true!! Okay, so who wants to compile a list?? (I can't, I've got finals in a week!!!)

One of the great things about the Supercharger, is that under the
ICD hard disk utilities you can set it up to be ignored, so that
you have a ramdisk that is ST-cold-boot proof. Turn the computer off.
If you haven't turned the Supercharger off, you can come back after
coffee and still find your data on its ram disk.

My last post had two mistakes in it. I should have said
#include "common.h" not <common.h>. Also, the opcode for appl_getinfo
is 0x82 not 82. appl_getinfo is NOT morally equivalent to scrp_clear!

I'm an Express sysop here in Montreal, Canada and I've been looking for
a qwk door for Express as well. One could probably write a script routin
to use Purple Mountain's QWK door, but I haven't really worked with the
scripts so much that I'd know whether it would be an easy or formidable
task. His best bet might be to call up C&R BBS (Express HQ).

> finals in a week!!!)

Thanks for that mail-address! You're right; it's no use writing messages as
single persons to Id. But we can collect names in our neighbourhood, and
send Id _many lists_ of those who support this idea..! For example, I might
send them a list containing 20 Finnish Doom-for-Falcon enthusiasts, and our
explanations why the thing should be done. You others, everywhere, could do the
same - with your own ideas and different names. The point? I think it would be
much more spectacular (?) to give them not just one list ("made by some lone
maniac.."), but many, clearly different messages. Made by clearly many
different people. That, combined with MANY names (all our friends.. ;-) should
prove that we're serious. If anything.. But there'll have to be _lots_ of us
doing this! Everybody is needed now. In England, people succeeded to get
Civilization for ST by doing this. If this works, we could try the same again
- e.g towards MicroProse (who promised Falcon-games, but...).
Let's start - and see what'll happen! There's nothing to lose..

463. SLM804 4 Sale

Newsgroup: comp.sys.atari.st
Date: 1994-04-10 23:23:00 UTC
From: dirk.vandenheuvel@nezuld.com
Message-ID: <17515.1288.uupcb@nezuld.com>
Source record: 189537

Here's some stuff that is just taking up space in my house. If you
are interested in any of this stuff please reply here or better
via e-mail at dirk.vandenheuvel@nezuld.com (and any REASONABLE offers
will be considered). Stuff I'm looking for in trade include 14.4 pocket
modem, ethernet cards (combos preferred), double-speed external
CD-ROM drives, 15" + monitors and laser printers.

Atari ST stuff:
SLM804 Laser Printer w/DMA Switch Box $300.
Magic Sac Mac emulator cart "complete" $40.
Supercharger IBM XT emulator box w/power supply $100.
Timeworks Publisher v.1 $25. VIP Professional Spreadsheet $15.
MultiGem Plus w/utils v.1 (doesn't work on STE) $20.
Populus (doesn't work on STE) $10. Kult $5.
World Class LeaderBoard Golf $5.
Atari (orig) joystick $3.

Misc. stuff:
Epson Action Printer 3250 24 pin printer w/tractor feed add-on
$100. Mint condition, still under warranty.
Commodore 1950 Multi-Scan Color Monitor. $375.

Buyer pays shipping and COD (unless pre-paid). All software is
original and comes with orig manuals, but no boxes (I threw 'em
away). No manual for the Supercharger, but lots of text files on
disk.

. CmpQwk #UNREG. UNREGISTERED EVALUATION COPY

>

I had the same problem with Atari OZZ, I ended up making 12 Toll
calls to them, they just kept pissing me around..

Atari OZZ even tried to call me collect..!!!

I did get 6 chips in the end, but at the phone costs, plus there was
a dud DMA chip...

A well know dealer here had a big clear out of Atari products, but they never
sold hard drives, when I rang them to tell them about this DMA problem,
they denied knowing any thing about it, this was the Dealer, not Atari...

Never ever buy any thing from this Dealer, there support is dismal..

469. Minixfs test version pl10

Newsgroup: comp.sys.atari.st
Date: 1994-04-11 02:52:11 UTC
From: shenson@nyx10.cs.du.edu
Message-ID: <1994Apr11.025211.6634@mnemosyne.cs.du.edu>
Source record: 189542

As I mentioned a while ago Minixfs can crash on Falcons. I still don't know for sure why. However I've made an educated guess at a solution and sent out a pre-release pl10 Minixfs to atari.archive . This is the XFS binary only, sources will come with the full release. Its filename is mfs10tst.zoo .

If you have a Falcon that crashed previously and doesn't
with this let me know. If it still crashes let me know as well. You can also use the GCC fixstk utility to increase the update stack, see if that changes the crash frequency too.
Steve.

RE: JPEG VIEWER

Perhaps you don't actually _need_ to make a viewer, just a convert to convert the JPGs into GIF (or other) format. Then Photochrome could view them more or less as they were meant to be viewed. It would produce the best results, at any rate. Converters wouldn't necessarily need a lot of RAM (they could be done in portions, saving to disk as it goes) and while it'd be slow, once they're converted, that's that.

Just my two cents, anyway.

The blitter is a slow piece of crap. It is still faster to write 68030
code to do graphics stuff. Using 65,000 colors on the Falcon is much
easier than the god-awful 256 Falcon mode. With the true color modes you
don't have to deal with the plane interleave. It would be nice and fast
if the 256 col mode was just straight non-interleaved 8-bit blocks.

DAVESMALL [Dave] at 01:49 EST

"It's been such a long time..." -- Boston, Album 1

Spectre 3.1 is done.

We'll be posting more details *quite* shortly about how to get your hands on it and what it does. Let me give you a brief overview of where I've been (and why).

In mid-November, 1993, I got a mild taste of what Eric got with a car. This time, it was Man's Best Friend, our Dog "DimWit NumbSkull". German Shepherd, regrettably overweight. I was sitting in the vet's office, had her on the leash, she was bouncing all over the place. I had my left foot on my right knee -- you know how ya can sit? Well, D.N. Dog jumped towards me, wrapped her leash around my left ankle neatly.

Well, I was just untangling it when the door opens, and another dog comes in.

ZOOM! DimWit NumbSkull races to check out the other dog. Leash snaps really taught (call her 100 lbs.) and my foot got yanked out, knee snapped forward. The ABSOLUTE WORST thing you can do to a knee is to move it in or out with your foot turned in, or out. (That's one way they check for knee damage. Try it. Don't press if it hurts, back off.) Wow, did it hurt. I hope her annual shots hurt. I mean, I'm a dog person, but for heaven's sakes...

So, it swelled up and all, went into ER, looks like knee cartilage torn. Go see a specialist.

Went to see same exact guy who worked on Eric (put rod in his leg). He said, "absolutlely classic cartilage tear. Let's fix it." We tried for before Christmas, but the insurance people moved too slow. It was then delayed for vacations and such, and they "did" me in mid February.

I got a "Welcome Daddy" hug from Jamie (5) who didn't know my knee was bad, which accelerated it coming apart, about two weeks before the operation. I was actually glad when the day arrived.

Hey, WOW is it fun to have someone stick a needle into your knee under your kneecap! It got better several years later, as the painkiller started to work, but it was no fun at all. They do this three places. Then they start water (or saline or whatever) running through the joint to flush out junk.

They have this TINY probe with a fiber optic light and camera hookup and "nibbler". The "nibbler" looks like the baby alien in "Alien". No kidding. They hooked it up, and in full living color, S-Video (spiffy!) was my knee!

Of course, there was some horse leaning IN on my knee from the left, and some mule pushing OUT on my leg, bending the knee sideways, so the surgeon could get a clear look at the tear. It was far back. He said "absolutely classic". They took pictures, said it was perfect for a book he was writing! (I'm not kidding). Meantime, the anesthesia guy was asking me up and down how to buy, connect, and run a CD drive on his Mac LC-III (I think). Not enough RAM type problems. (Surgeon grumbled to my wife "I talked all through the operation!").

Another amazing thing is the refrigeration in those operating rooms. Waaay cold.

Anyway, it's all fixed now, I have some scars to compete with Sandy's, and the knee works better than it has since before college. (Really). Lots of stuff in there came out that needed to and a lot of rough surfaces got smoothed down. And Gee, I got to see it all on S-Video! (This is a higher quality video than like NTSC, the normal.)

The video was odd -- it looked like Jacques Cousteau movies precisely -- all underwater -- some Alien thing nibbling at the cartilage tear, smoothing it down so everything would work smoothly again. It did the trick. But it was weird, I tell ya. (The swelling is just finally going down, here in late March. THAT is how hard HORSE and MULE were leaning on my knee. Ouch.)

Anyway. From November on I found it a bit hard to work, what with this knee brace and all, and the the pills they feed ya. They do improve your mood, but your focus and concentration just fly away ... the brace is LOTS of fun, about 700 feet of velcro and many steel rods you wrap around the knee to ensure it doesn't bend. Trouble is, steel rods work their way up and out into a "sensitive" anatomy region (shall we be delicate about it) especially at night. Never did find a solution to that.

Okay, next note will talk about 3.1. The knee is back, I'm going to be back online a lot more since I need to be, and the limited time I can work won't all be focused on 3.1.

I also needed a bit of a break to get my perspective back. I understand people need 3.1's capabilities, but when it just plain crashes, it just plain crashes. I can't ship that! I got 8 faxes from someone with "3.1" in HUGE letters covering the page. (Maybe I should have just shipped it to him and said, "look, it don't work yet?)

-- thanks, Dave Small / VP etc Gadgets by Small

Message 2 Thu Mar 24, 1994
DAVESMALL [Dave] at 02:13 EST

OK. Here's 3.1's status.

As you know, we looked at System 7.0 when it came out. It crashes with an "out of memory" error. We traced that to an IPL (Interrupt Priority Level) test, which was simple: If you were running IPL 0, you passed; if not, you crashed, with the error selected as "Out of Memory". Since Ataris MUST run at least 2-3 to avoid horizontal blank interrupts (and dreadful slow speed), I could almost believe this is an attempt at an emulator killer. I don't know. I DO know it took an all-night trace, the trace running 9600 baud into a fast PC clone that stored it in a disk file (ever tried to find a telecomm program that can do SUSTAINED 9600?) and waited until it crashed NEXT MORNING. At the end of this huge file (ever tried to EDIT a really big PC file? WordStar finally did it.) I found the IPL crash. WEIRD. They also had unhooked the 128K ROMS from everything ... serial interrupts, mouse interrupts, Line A, Bus Error, Vertical Blank, One Second tick, and so on. I really don't know how much or little of the ROMs they even use on 7.1.

3.1 gradually became stable. There were the usual bugs in development, because we added and changed a lot in preparation for what's coming (Spectre does NOT stop at 3.1!!!) The CONFIG file would not save SCSI status. You could not select a boot drive more than the first drive displayed. Things like that -- annoying, and all in "C", a language I'm real expert in (hoot! *haw!*) But found and fixed.

There are now two menu entries, ACSI and SCSI. If you don't have SCSI (e.g., not TT) then SCSI is greyed. Each has 12 or 16 partitions (can't remember, it's midnight) displayable. You can turn on/off/format into OOP partitions either ACSI or TT SCSI drives.

Then, basically, you can use your TT SCSI drives as Spectre drives. It sounds simple, it was really BAD to implement. I had to finally bring in a SCSI whiz to help me debug it. Simple: SCSI problems on the motherboard. (1st production run TT). We had a "newer" TT, that fixed it, essentially.

We also did our best to de-timing-loop the machine, so you can set your TT or SST or whatever to warp drive. As far as we know, you're safe up to whoever knows Mhz. Maybe that 64 Mhz 040 board would fail, I don't know. (Like to try!). But this should get rid of the annoying "turn off caches" stuff. It seems very solid; I used it a lot while debugging 7.1.

So, in 3.1, you have the boatload of little fixes we've been adding from bug reports since Jan. 1991 (3.0's release date!), a machine independence for speed (although 8 Mhz cruises along just nicely), TT-SCSI support (and in general, that sort of speed support). I know several people who would chew my arm off for TT-SCSI drive support, and others that want to turn up their accelerators, and I can dig it ... I like it too. That's why the Camaro.

As it happens, we "froze" the code in January, and I went after 7.1 when I was, errr, mentally able. (quit smirking, you!) I believe the problem is the CLASSIC MultiFumbler zero-READ (not write), which does not cause a bus error. It is not reading 0, it's like reading 2 or 4 or 6, the ROM locations. Bad data, etc, crash. I have to sic the Zax on this one to find and fix it. Good news is we FIXED this stuff before -- this was what crashed Microsoft Word 3.02 (remember that war?) and MultiFinder 6.x.x.

So rather than hold you up any longer on 3.1, I'm going to "shoot the engineers" (old saying: "Somewhere in the life of a project, you're going to have to shoot the engineers and actually ship.") and ship this thing out of here.

3.2 will follow on with the 7.1 with MultiFumbler fix. (Remember, when they went to 7, MultiFumbler became mandatory... no more Finder.)

About TT Memory --

I've done some really tricky experiments (in terms of getting them to run) in swapping TT memory around to speed up performance. I have to do several BIG changes to Spectre before this can be fully done and you have like a 12 meg machine. (Caution: Not all programs will tolerate 12 meg of freespace. A common bad MacHabit is to request 8 megs of memory, knowing it will fail "because of course a Plus has 4 megs only", and that causes a memory compaction in the Heap. Well, if you have 12 megs and it works, that program may flop. 8 Megs appears more stable, and is a more "supported" Mac size, whatever that means -- programs are more willing to "see it").

I have solved the problem of getting TT memory to be ST memory, which one Pundit has been telling folks is impossible. However, there are such big changes required, like a whole new buffer setup, that I am not comfortable putting them into this code. I think it is a far far better thing to get the TT users and high Mhz users up and solid than to crash them on an untested RAM scheme. I have a 12 meg TT, I understand you want it, but hang in there a bit longer.

The memory menu thus goes to 14 Meg (Falcon, remember), but above 4 meg will probably be greyed, since the 3.1 is frozen and I'm working on 3.2 now. You never change a frozen version except for bug fixes, and then you line up various ST versions and test. So far, so good. Even the Mega STE no longer has the 4 meg bug, where non 4-meg Mega STE's would crash (a cache conflict).

--> con't

Message 3 Thu Mar 24, 1994
DAVESMALL [Dave] at 02:42 EST

The Falcon030 is not yet supported. It's just greatest good for greatest number; System 7.1 is needed by more people.

Color Quickdraw I won't comment on, because of all the work I've done. Enough said.

For now, there isn't much point in Revving the manual, since it will change in 3.2, when other things come up. (For example, you will see menu options to enable or disable ST and TT RAM, to do it YOUR way.) But they're not going to let you select all TT RAM yet; not until people run the new buffer scheme and I'm sure it works. MMU stuff can be mighty tricky, and persuading a 24-bit machine (e.g., Mac) to allow me to swap in 32-bit memory (where TT RAM is is "past the end" of 24-bit memory, past 16 Megs; it starts at 16 megs) was most entertaining. Jeeze, I can feel the knee brace still digging into my, errrr, ankle.

I would recommend the bug fixes to anyone. We found a couple lulus that should not have gone out in 3.0. Ooops... well, it worked well. 3.0 was a VERY good release.

I believe the "disk hiccups" and "keyboard freezes" some users have reported will stop with 3.1. The disk routines are TOTALLY REWRITTEN (again!) with an eye for machine speed independence. This is really not easy; there is no easy way to force a given time on the machine, when you can't easily find out what sort of machine you're running on, if there is an accelerator, and so forth. For you programmers, just TRY doing a tst.b on MFP bit 5 (GPIP) to slow you down. Everyone SAID that would cause an 8 Mhz cycle. On a ST, it does. On a TT in cache, it runs twice as fast. Without cache, 1.5 times as fast. I don't know why, I just measured it on the scope instead of taking it on faith.

The timing-independence was difficult but the TT seems steady now, been using it for months (on 3.1, of course). But I'll head back to the Zax now, and that's 68000 only, on one of the Megas.

The next two goals are to finish stomping 7.1 into the ground, and to bring online the extra TT RAM. Most of the code is there, the menu options are there (greyed sometimes), but I know there are borderline situations I am going to HAVE to test. (Border conditions between ST and TT RAM are especially tricky, and they positively will happen).

All the goodies like tailorable menus remain the same.

On XGM (Atari's past 4 partitions formatters since AHDI 3) WE NOW SUPPORT XGM PARTITIONS. We can handle 14 per drive, since Atari more or less set that limit. (Actually we could go higher, but good heavens, 16 icons on your desktop?!?) We have an adjustable total of 16 partitions mountable; I can increase that if someone needs it. (What, running a 5 gig hard disk?)

XGM partitions required a plane trip up to Oregon and seeing an old pal again. Hint: He's helped me before a lot with "C" stuff.

The SCSI stuff required bringing in a pro and logic probes and stuff, until we figured out the out-of-sync condition was the machine (which we could regularly lock up as it got hot). Welp, that's how ya learn.

GCR code was already pretty time independent, since it slams on the cartridge port so much. This just gives it more overhead to work with than on 8 Mhz machines.

So. With XGM, we're current with Atari's disk drivers. With SCSI, we're current with TT. With high Mhz independence, we can handle various accelerators, even one called SST at 40 Mhz. That is trans-warp drive, folks.

And the bug fixes are ever-welcome.

So. That's the delay, what we have NOW, and what is coming soon.

I no longer walk the dog with a leash; I never want to get shots under the kneecap again. Whooooooo.

We'll post some details about how you can get your hands on this as soon as the literature is complete (I'm writing, I'm writing!). Sandy just got a pack of 1500 fonts and is dying to use them, too, to format this.

Tell you what. There are a LOT of people not on GEnie who would like to know that Gadgets is still alive and 3.1 is done. If you feel like it, could you repost these as necessary to the Net? My Visa/MC just ran out (of course) and my Internet access is closed until the new card "wakes up". (I have the card; Visa/MC does not have it in their blasted computer yet, nor given me the PIN code.) Probably comp.sys.atari.st would be a nice place to put this; it goes to a great number of Spectre customers.

(Let's not have 15 posts of it, though, ok?)

Thus, for reposting, while these notes on 3.1 are copyright, you are free to reproduce them as long as you do so completely, so the next person gets the news same as you did.

Questions I won't answer: What was the stupidest thing you did programming while taking weird stuff a week before your operation?

(Fortunately, I can't remember a lot of them.)

Anyway. I'll try to be online more now that the intense war for 3.1 is behind, and if any bugs show up, we'll catch them in 3.2. I don't think it will take long to show up (knock wood) because we spent so much time researching how to find and kill zero-reads...

We have had someone answering our Gadgets line (or at worst, returning calls) for quite some time now.

PLEASE DON'T BUG HER ABOUT 3.1 EVEN IF YOU NEED IT YESTERDAY. Until we have something to ship, we don't want to say "Go!", ok? It takes time to get disks duped and CHECKED (we have been loused up so many times we must check them!), and I kinda wanta do a new PD disk if time allows.

Naturally, when it's "Go" time (which is a LOT sooner than "Real Soon Now"), feel free to call.

I'm sure I've forgotten some things in 3.1, but the point is, we're moving and have a definite direction. And yes, we think a lot about Spectre 4.0 on the horizon, with all those neat color cards out there. I wonder how hard it really is to program a Tseng Labs ET-4000 chip?

It's good to be back.

Thanks for being patient with us, folks. Wow, have we had our share of fun.

Enjoy 3.1.

Try ftp.cs.tu-berlin (or the mail-server). That site usually gets new
versions of EGEM very quickly. You could also try ftp.tu-clausthal.de
as well. The filename is usually EGEM_135.LZH but there is now a 1.40
version available, so try looking for EGEM_140.LZH.

To upload a file to comp.binaries.atari.st or comp.sources.atari.st you
should send your submission to avg@cwi.nl where the moderator will look
at it, make sure it works, and post it. I think the archive needs to be
a ZOO archive, though, and the UUEncoded pieces should be no larger than
45K.

If any of this is wrong, I'm sure someone will correct me.

Date: 1994-04-11 08:59:38 UTC
From: tskuenne@cip.informatik.uni-erlangen.de
Message-ID: <2ob3hqE80o@uni-erlangen.de>
Source record: 189401

The discussion about cd rom drives on the Atari gives me the opportunity
to add another question matching this subject:
What programms are there to control the cd rom drives in order to
play audio tracks?
I had some programms (sorry, i do not remember the names) but the all
failed to work with my Apple CD 150 which is - yes, i know - a somehow
outdated drive...
Is there a programm that reads a config file where one might specify
what commands are passed to the drive?
Any help is apreciated...

Seeks tend to be especially slow because of the need to change CD rotation speed as you cross tracks.

In Computer Shopper (UK mag) the CD300 came out tops; faster than some triple speed drives. Depends on what you do in your benchmarks of course. They tested it with Mac (obviously) but also with a PC (+ SCSI card).

The CD300 is advertised at 155 quid (but by a company that doesn't have any in stock!) Anyone know anything about the Toshiba 4401 (not 3401) which is advertised at less than 150 pounds? It's internal, SCSI-2, dbl speed, that's all I know.

Due to upgrade to Falcon, I have an ST hard drive for sale. (By detaching
the interface card, it is compatible with the Falcon too, but I now
have a different drive for my new machine).

Summary:
105MB drive, including case, interface and cables: 250 GBP
70MB slower drive, uncased: Free, with above
Includes UK carriage. If within what I consider to be
a reasonable distance of Reading or Abingdon, I can deliver,
and give assistance setting up.

Details:
It is a Quantum LPS105 105MB fast SCSI drive, in a largish box (designed to
sit under the monitor). The box contains the power supply, the adaptor to
translate from the Atari DMA port to standard SCSI, and the drive. There is
room for one more 1/2 height 3.5inch SCSI drive, if you wanted to expand
later. The box has DMA in and out sockets (the latter for adding another
external drive, or an Atari laser printer, or whatever), and a standard SCSI
port (I used this to attach a tape backup unit). It comes complete with the
necessary cables, ie one that attaches the drive to the computer, and one that
supplies the mains. The DMA to SCSI adaptor is the ICD adSCSI+, which is
better than the ICD Link which most dealers sell now, and includes the
best hard disk drivers available for the Atari. It includes a battery-backed
clock to automatically set the correct date/time in the Atari when rebooted.

I will also give away with the above drive, a second hard disk. This is
70MB, is slow, and won't fit in the same box as the main drive. Basically,
if you can make use of it by getting another case and power supply, then
it may be useful. Otherwise, give it away yourself or sell it.

> one. Mind you that might just have applied to the UK...

I can tell you that it can't be true, because I haven't had
mine fixed, and it's one of the buggers, also got SIPP
sockets instead of SIMM's...suppose I better get it sorted
one day!

Sorry for the wasted bandwidth, but...

Can anyone tell me if the laxer_1 and lazer_2 files at atari.archive
are for the Falcon only, or are they for regular ST's as well?
I FTP'd them already, but am wondering whether to save the disk space for
these files or not. Email or post a reply. Thanks in advance...

: ATARI's DSP modem may be vaporware, but NOT the "DSP-modem" ... several people
: are doing them, the PROBLEM being the EXTREME cost of selling them legally ..
: that is, get the permit for connecting them to the line ..

I was thinking about this legallity problem. Why don't ATARI produce
some kind of hardware buffer from the DSP port to a phone connector and
DSP thruport? With this standard we could have many phone-line applications
and only ATARI would need to foot the bill for a little green circle.
(A little green circle means legal to connect to BT phonelines in the UK.)
This bit of hardware could ensure that no stray signals make it down the
phone and with the right software protocols auto-answer, hangup and so on.

Does the hardware on HiSoft's VOICEMAIL have BT approval?

If ATARI won't do it then I'm sure a third party could corner the market
on that single piece of generic hardware that anyone can develop
phone applications for.

From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1700@usdtsg.DaytonOH.NCR.COM>
Source record: 189410

I've been noticing the uploads (and slight discussion) about the
various networking-type utils that are being ported to the Atari under
MiNT, in particular Sockets, etc. I was wondering if someone could
explain for a network-neophyte (i.e. me) what exactly this allows
you to do. I mean, if I wanted to FTP *directly* from my Atari
to an FTP site, would this allow me to do so? If so, how would I need
to be connected into the net in the first place?

Any explanation would be appreciated. Thanks in advance...

This game is slow for two main reasons:
- the TC mode, yes, but it's not the major point.
- the way of coding: A. Linz uses REAL 3D bitmapping, which means that if he wanted to, he could make you turn along every axis, walk on the walls, and so on...He also manages light with 32 levels of intensity.

I spoke a bit with him, and he told me that Rickard Troedsson (from Sync) explained it how to speed things. However, it's a lot of work, and he hasn't got a lot of time.

I thought it was on a NEXT-step machine. (I don't blame 'em, it's a nice
machine!)

>The game would be possible to convert to F-030 - but the question is: WHY will
>they NOT do it..?

Well, I suppose it is a bit of work to convert. I mean, at least the Jaguar has
all the custom chips to make the texture mapping routines a bit easier to
handle. The same hardcore 3D routs would have to be developed from scratch on
the Falcon. I personally don't think it's as hard some people make out- after
all if the routines can be developed in PC assembler, then it can't be too hard
in comparision for similar routs in 68030 on a true-colour screen.

>And... Where is MP Formula One Grand Prix for Falcon..? They could convert the
>existing, very good PC-version VERY quickly and easily.

Er, same problem here I think. Converting the basic code isn't that much of a
hassle, but converting the actual routines for sound and graphics would be much
harder, and a bit more of an undertaking for a software company. (Again, not
as hard as some people make out.)

Michael.

Yes get COMA 180, its crippleware and COMA 190 should also be out RSN..

But I think it will cost you some 80dm to register it, it only prints
500 lines in its demo state, thats about 30mm of Fax paper....

OK, I just tried to compile mint with the stuff azog@world posted. Before I began I needed to compile byacc (I know now that byacc.ttp isn't needed) and the loader or linker complained of an unknown symbol "___main" in main.o. So I took a binary editor and changed the symbol to "__main" and the loader/ linker was happy. But when I tried running byacc.ttp I got an error. Same thing happened when compiling genmagic.ttp.

So, why is gcc creating this symbol "___main" that the linker doesn't like?

I was really hopefull that I could compile mint. Btw, it took my 520ST better than 4 hours to compile all the .c files for mint. I'll do it before I go to bed next time.

Thanks, Randy

}The main issue is what the standards are. MultiTOS is the standard. MultiTOS
}also provides a much better environment for developers. For these two
}reasons I suspect you will find more MultiTOS specific programs than GENEVA
}specific programs.

From what I understand, any well written program "for MultiTOS" should work fine under Geneva... I think speaking of "standards" in the Atari world is almost ridiculous! I'm not trying to be argumentative, but aren't we all Atari users because we are not afraid to say that the standards suck!-) Personally, I'm *vastly* more impressed with Geneva than I am with MultiTos. IMHO, it will be a shame if Geneva does not become more widely used than MultiTOS. Also, if we are Atari users because we refuse to compromise and use standards that we feel are inferior, then why should we use an inferior OS on our machines?

}I think GENEVA is a good product if you have an ancient system and need to
}run a few programs at once. I wouldn't expect any REAL multitasking from
}it though, and forget any new features such as drag-n-drop. If you are
}buying a new machine - get MultiTOS and install the Minix.xfs. The speed
}gain of Minix.xfs combined with the new MultiTOS should smoke any third
}party OSs.

GENEVA multitasks just fine. I don't know what standard you are using to define "REAL" multitasking. I've run multiple copies of ST-ZIP (compressing large amounts of data) while a small line-drawing program was running (also multiple times in ram) while Petra/Paula was playing (and loading) Random .MOD files, while GEMView loaded .gif files in the background. All of this worked fine on a 25mhz 68000 (original Mega4 with a T25) on a completely non-accelerated graphics card running 1024x768x16 colors. Background processes worked just fine except while ST-ZIP was running, then they got a little slow (which is understandable)! If I really stress the system out like this, I *will* occasionally get a system error, but this is surprisingly seldom.

}MultiTOS a slow dog? Well, its an emerging OS. Geneva fast? No, it just
}doesn't multitask and doesn't poll during program execution. The polling
}during program execution will be gone from MultiTOS soon, and then you will
}likely owe the net an apology because I'm getting SICK of Gribnif!

If what I described above is multitasking, GENEVA does this just fine. I agree though, that some of Gribnif's advertising may have been a little misleading. Still, I think they have reason to be somewhat egotistical about the whole thing. Geneva is a *damn fine* product!

>Andreas@AEO

A CD-ROM driver. I am not sure what you mean by front end software to read non-Atari CDROMs. If you mean any CDROM (like the ones that have game software in them - you would need an emulator of some sort. If you just mean CDROMs that don't say Atari on them but have a lot of file formats that you can access (like source code, gifs, wavs, etc) then yes, the driver is sufficient to give you access to the CDROM and your software then plays the wav or views the gif or edits the source. Does that help? Wayne

--

I made some changes in the last non-MiNT version I've found on the net (it was bash1.12) to make it works the way it works on my Linux-box. It's fine now, and some people here at Brainstorm uses it every day. I also cross-compiled and installed all the Gnu software in it, except gdb that could'nt run without MiNT. Everything works fine and I want to make my complete installation available as a package for those who dont want to do all that job by themselves. I will someday.

Unfortunately I've lost my Internet access some time ago :-(so I just cannot put it on an ftp site right now. I have to wait until some generous people can give me a dialup internet access here in Paris (dreams) and then it will be uploaded on ftp.cnam.fr:/pub/Atari/

Please tell me if it's something urgent, then I'll put it on my BBS for you can download it using a modem and a long-distance call :-)

> I don't think there was ever any serial numbers, just the DMA chip
> part number..

Atari was never very forthcoming on this subject, and received quite a bit of flak from dealers because of this. My understanding in this part of the world was that there were a number of unreleated problems with early STEs.

One concerned a foul-up by a production manager which resulted in the specified buffer circuit on the STE DMA (a 74LS...) being replaced with a version with incompatible signal level (a 74HS... part number). This fault was I think the main one which could be identified by unit serial numbers, since it had only occurred on certain production runs. It was the one that was most irritating at the time, since it would have been easy to alert retailers to the numbers affected. In fact a general recall would have been in order, as the fault only makes itself dramatically obvious when using certain harddisks (not all). There are almost certainly early STEs still in use where the owner is unaware of this potential source of grief, either because a harddisk has not yet been connected (and written to), or because the normal range of signal tolerences has allowed a particular combination of STE and harddisk to function apparently with little or no problems. Then some day a new harddisk is attached, and &%$#"!!!

> If your chip has C025913-38 then you have problems....

DMA chips have historically always shown problems in certain production runs, partly early design faults, partly production not up to specs.

> I did get 6 DMA chips from Atari OZZ for FREE, with C398739-001A as the
> part number....

Local reps have occasionally shown real helpfulness :)

I have an Atari 1040 STe, and I used to try to keep up-to-date on new software and gear until STart magazine folded and took off with my money and Atari Explorer began arriving less frequently and then not at all. I used to count on the magazines for information on new products and for ads from mail order software dealers. I occasionally pick up one of the British ST magazines, but they don't do me much good in terms of finding dealers in the U.S. Are there any magazines currently published in the U.S. that are along the lines of STart/Atari Explorer? Getting a different computer is not an option for various reasons. Thanks in advance for any information you can provide.

This is the situation that I find myself in. I'm having some problems
with an ICD ADSCSI+ that I just received. I remembered it going around
the net that a hard drive wouldn't work on some STEs because of the DMA
chips. Now I can (gently) rip my STe apart to see if mine is included in
that lot.

524. Atari Ghostscript Info available via WWW

Newsgroup: comp.sys.atari.st
Date: 1994-04-11 23:44:52 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <2ocndk$9p@geraldo.cc.utexas.edu>
Source record: 189448

Hi,

I have set up a section under my World Wide Web (WWW) home page for
Atari Ghostscript. Atari GS users (and prospective users) may like to
check it out. Point your WWW browser (like Mosaic) to

http://godel.ph.utexas.edu.

You will find my home page under Personnel/Tim Gallivan.

This site currently contains:

1.) A brief description of Atari Ghostscript.
2.) Links to Atari ftp sites, as well as sites for the standard source.
3.) A (not so good) screen clip of what Atari GS looks like.
4.) A list of new features for the next release.
5.) An http formated version of the Ghostscript FAQ list.

Please email me with any questions or suggestions for improvement.

BTW, regarding item 3, I would like to get some better screen shots.
Can anyone suggest the best method for capturing a screen image in GIF
format (I can covert to GIF with the ppm utilities if necessary)?
In addition, would anyone like to donate some nice 8-bit color screen
shots? I have only a monochorme monitor.

Thanks,

Tim Gallivan

Your game is an excellent demo of what can be done, when people throw off their
suspicions and decide to make a good program. I believe you will improve it a
lot - but even now... It's really impressing. More games like this!
(Sigh..) What would become of DSP/Blitter/16-bit sound coded Formula One G.P..?
Texture mapping, realistic sound, improved gameplay, ... Of course, (too many)
people now say: "Stop dreaming - it can't be done!". But who care? You have
showed with those 16-bit graphics that very much _can_ be done.
When somebody just does.

> Anyway, that's a real good Idea to ask ID a Falcon-version. I'll try to send
> them a list.

Excellent..! Instead of complaining how miserable we (and Falcon and Atari,
etc..) are - and without hope - we can, and have to do things ourselves.
Perhaps, Atari will some day wake up - and support us better again.
Make that list - I'll do mine - and hopefully the others will follow..

Correct me if I'm wrong, but BT needs to approve both hardware AND
software of a modem before it dishes out a green circle.......

Hence such things as number blacklisting on UK (and some European) modems
being implemented in order to gain approval.

Cheers, Steve

:>you optimised every single piece of code.

Sorry Rickard but your wrong, DOOM is written and compiled with WATCOM C 9.5
which produces better code than an of the Falcon/ST C compilers. The Time
critical routines are written in optimised assembler so it is wrong to say that
DOOM is NOT optimised. I reckon a straight C port of Doom running in TRUE colour
on the Falcon with the relevant assembler routines converted would run at about
10 FPS. I also think that since its written in C it wouldn't take more than a
few weeks to port.

Well for disks like GIFs I have used the LINK drivers and it works
well. I was curious if they were coming along with programs to run
disks like Microsoft Bookshelf or the Encarta disk. Running the
Mayo clinic disk on my TT030 would be really cool.

Hi, has any else had this problem with the New ST ZIP 2.5..

Well it worked with Version 2.4..

There is a option to create a Directory, but if I use
it it come up with a alert Box with unable to find folder..??

Or some thing to that affect...

Thanks.....

There are 3 Atari mags in the US- ST Informer, Current Notes
and Processor Direct (have you read P-Direct's press release in
this group?). I subscribe to both ST Informer and Current Notes
and enjoy them both. However, don't expect the glossy color
of STart or Explorer. They both have lot of information, though.
I don't have the addresses or the phone numbers for them right
now, but if you e-mail me I'll get them for you. Or perhaps I
can post them later. I'll try.
BTW, Processor Direct is a brand new publication and I have not
seen it yet. I will be sending my money order in for a copy
soon, though.

CGS ComputerBild has three interesting programs, Inshape, DA's Vector,
and DA's Picture. These programs do a wonder with modelling and
picture manipulation.

Lexicor software is a good choice because it is resolution independent,
and while an image displays 16 colors, it can actually be 24bit.
Chronos 3D, Xenomorph, and Prism Paint 2. They also have separate utils
which will do file conversions.

Might I add that DA Picture and DA Vector are distributed by Lexicor Software,
and DA products are originally by Digital Arts, in North America. And yes they
are very good products, if you are interested about any of the DA Products
please email me at ysiu@lexicor.com

>

So can DA Picture, Picture works in 24bit only, Vector too...I think Feldak
is looking for a painting tool, and xenomorph, chronos are animation and
modelling packages.

Cheers

Those are "assembler-with-preprocessor" files, you need to run asmtrans.ttp
on them to spit out assemble-able .s files.

Which version of gcc did you grab? Seems like you didn't grab the most recent
gcc library to go with it.

Doom was written using a NeXTcube, networked with a variety of other computers, according to an article in Game Developer magazine. (Premier issue, actually.) It is written almost entirely in C, in fact. (They say there are only 2 machine language routines.)

Not to say any of that is relevant to this discussion, but I thought it was interesting.

> [...] So, why is gcc creating this symbol "___main" that the linker doesn't like?

This is something to do with having an out-of-date version of the libraries.
___main is of course just __main with an extra _ in front of it, and __main
is a c++ -related thing that has to do with initialising static variables
or something like that.

If re-installing gcc doesn't appeal, try just writing a dummy __main:

void __main{}

and link that in.

|> they're converted, that's that.

The Independent JPEG Group's CJPEG and DJPEG standard software will convert from JPG to GIF. I have compiled this a long time ago on my Falcon (but using an ST C compiler) and when I can get them ready I will upload them to UMICH.

The problem with this method is that GIF's converted from JPEG's take up an awful lot of disk space, as do JPEG's converted from GIF's, because the 256-color reduction in a GIF and the DCT errors in a JPEG create different types of image artifacts. 720k of JPEG's could take up 2-3 megs if changed to GIF's. But at least you would get colour, which is better than I could offer with an ST version of my JPEG viewer.

AFAIK Id Software is helping people convert DOOM to their machine.
IMHO Doom should run quite nicely on a Falcon, assuming the graphics
are chunky (well, I come from the Amiga side of things).
There is already a 680x0 version of Doom - the NeXT version.
Sadly I don't have the address of Id Software, but I'm sure that
when you find it you could have Doom for the Falcon in no time.

>had a serial line parallel to a power cable, so noise jumped from one to
>the other). Try to get as short an RS232 cable as possible.

I figured it out... got my 486 on Friday night, so I tried it on
that and got the same results :-(, so I figured it must be the modem
or the cord. Restoring the factory config in the modem did the trick,
some nasty program must have changed something. Dunno why I didn't think
of trying that in the first place.... I guess not many programs store
their changes like that!

Thanks for the help!

Hello

There was a thread recently about viewing jpegs on an ST, and someone replied
that they could convert jpegs into gif format before viewing with Photochrome.

Well, if anyone was wondering where to get a conversion utility, then you can
can anonymous ftp it from micros.hensa.ac.uk

path to directory: micros/atari/tos/n/n070/<files>

Enjoy

Danny

Eek! What has changed in MTOS to break the CDROM.XFS? I also understood there were _several_ versions of the XFS around, perhaps only some work with MTOS > 1.04.

No, not yet. How reliable is the Mac RAMdoubler?

Any version for the Atari would probably only work on machines with
PMMUs in (Falcons or TTs basically).

560. Doom for falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-04-12 11:19:55 UTC
From: sa314@utb.shv.hb.se
Message-ID: <sa314.3.2DAA83DB@utb.shv.hb.se>
Source record: 189384

Well at last i know how to mail to the list!

Hmm. I read the comments about doom on a falcon. Of course its possible to convert it from the pc to the falcon. The only problem is that it is going to be VERY slow!! I've got a falcon myself and have tested how much data it can move to mem, and with move.l (a0)+,(a1)+ it can put ca:68400kb/vbl. One truecolor screen 320*200 consists of 128000kb. And if you are going to texturemap you will have to use move.w which means it takes 4vbl just to fill the screen. Then all the calculations will take a lot of time. Maybe you say, why not use 256 colurs mode. The answer is that to texture map you need a chunky pixels mode(1byte/word/longword per pixel).
Truecolour mode is the only chunky mode on falcon. So if you want to use a bitplane mode you will have to make a routine that converts from chunky to bitplane(These routines takes a lot of processor time). I'm not saying that the falcon is a bad computer, its great! but not at moving data. So dont expect to see doom on falcon, lazers of men is about what well get.

Well that was all for now!
Bye!

Hi,

Given the price Working Til[t]e can charge for their fonts (now seemingly handled by the UK ST. Review Mag) I guess the answer to my question is NO!

But seriously, are there are PD Calligrapher Fonts and/or will the Latest Version of FONTKIT 4.1 (?) help in this matter?

Lez

PS. Did anyone buy the ST Review Calligrapher Upgrade and Manual 'cos my copy still talked about GDOS and LA routines which Calligrapher now seems to get round in a different way? I wouldn't have minded if there was a Release Note (or README.doc) explaining the changes - but there wasn't! Not to mention a note about how you installed CAL.PRG on hard disk so that it didn't keep asking for the 'key' disk. (But I figured that out for myself!)

You might be thinking about the program FATSPEED which anyone
with TOS 1.0/1.2 should have. It makes using the harddrive actually
usable. It's not specific to simply "between hard drive and floppy"
but speeds up hard disk access in general. It, and other useful
stuff (like Pinhead 2.1, which speeds up some loading into memory
of programs) can be found at atari.archive.umich.edu and other
popular sites...

From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1703@usdtsg.DaytonOH.NCR.COM>
Source record: 189387

I was wondering if anyone else has run into a bug with the
Lharc-Shell included in the LHA3.TOS program recently made available?

Specifically, if I run the shell (in ST Medium or Hi) it works fine
(on a rather simple setup). However, if I try to run it from
Geneva (release 003) I automatically get a little bomb picture (doesnt'
look like a system bomb) and a message saying "Lharc Shell can't
run in this resolution/mode" (I'm paraphrasing, but the basic
idea is it thinks it's in some "illegal" screen mode or something).
This happens in both ST Medium and Hi modes.

Anyways, if anyone has any ideas, let me know. Since Geneva and
Lharc are both useful items, I'd hate to do with either one
(well, I can use Arcshell, bit I'd like to be using the Lharc-shell)...

That reminds me, I haven't finished writing my cross-compiler cookbook
yet...

Get the source for gcc 2.5.8 from your favourite GNU site.

Get the patchs to build an Atari cross-compiler from
atari.archive.umich.edu in Gnustuff/Tos/Gcc/gcc258s.zoo.

You'll also need the patched gas sources from there, and the patched
binutils from there (in Gnustuff/Tos/Gas and Gnustuff/Tos/Utilities).

So who's going to do that? id Software sure isn't, they've got other
things to do rather than wasting a lot of time hacking away on the
Falcon. I'm not going to do it, I hate assembly programming. Are you?
Then call them and license the port! Stop flaming away like an idiot
and _do_ something to help your favourite computer.

That's also the problem in Germany! Getting a permission on the hardware
seems to be no problem - but the software could be changed almost easily
and therefore does such a system never get a permission!

570. Speech Recognition and SIRDS

Newsgroup: comp.sys.atari.st
Date: 1994-04-12 13:25:48 UTC
From: rgibson@cs.strath.ac.uk
Message-ID: <2oe7gt$gcf@dunlop.cs.strath.ac.uk>
Source record: 189393

Hi, I've posted questions on these two topics before but I
don't think they actually made it to the group.

Firstly, I am very interested in getting information on any speech
recognition packages for the Falcon/ST - especially source code (C).

I've heard of one for the Amiga which samples sound through a sound
sampler (strange that ;-)) and recognizes about 80 words or so - it
also has a shell with it to execute the commands.

Basically anything interesting at all about speech rec. would be handy.

Secondly, there have been several posts from people about getting
SIRD programs (the 3D dot picture thingies) but I've not yet seen
where I can get one for the ST - anybody ?????????

573. Falcon & GFA's HARDCOPY command

Newsgroup: comp.sys.atari.st
Date: 1994-04-12 14:16:49 UTC
From: hutch@ilmen.lanl.gov
Message-ID: <9404121340.AA00443@ilmen.lanl.gov>
Source record: 189396
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Someone recently told me that GFA BASIC's HARDCOPY command (the built-in screendump that makes an XBIOS(20) call) doesn't work on the Falcon. Since my old Epson printer is temporarily out of commission I am unable to double-check on this. I'm aware that HARDCOPY or the ALT-HELP built-in screendump only works in ST compatability modes and only on Epson compatible printers.

Could someone please confirm (or deny) this for me and let me know?

Thanks!

-Hutch- @ Fair Dinkum Tech

Please reply to hutch@ilmen.lanl.gov as I'm using a temporary mail poster.

574. Adding a drive which is emulated by a piece of software....

From: ipoorten@cs.vu.nl
Message-ID: <Co5Hou.KI7@cs.vu.nl>
Source record: 189397

Maybe the subject line is a bit difficult to understand, but I didn't knew how to write down what I actually mean in one line...

I'm planning to write a shareware or pd 'on the fly' compression program for the Atari ST(e) like the well-known stacker for the PC. What I need to know is, how can I make TOS think there is another drive available, say drive J? What BIOS calls do I have to bend for that?

(I know I can possibly use the same trick used in RAM-Disk programs, but I do not have any sources of RAM-Disk programs.)

Any comments are appreciated, both by email or posting to this newsgroup.

Thanks in advance,

Ivo van Poorten.

I am using gcc2.5.8, but the libs are older (not sure which rev). I got the
latest mint libs but didn't set my LIB pointer to them. It was an oversight,
but I figured it didn't matter. Apparently it does.

Thanks, Randy

I am stuck with a rather old adventure called "Legend of the Sword".
It was distributed by Silicon Soft. If anybody knows about this game,
or knows about a book with the solution, or has any hint whatever it is,
would (s)he be so kind as to let me know?
Any help will be greatly appreciated...
Riccardo Distasi

P.S. I posted this by mailing to comp-sys-atari-st@cs.utexas.edu
because I do not have direct access to usenet. If anybody has an
answer, email would be preferred whenever possible.

>hy>Yes, the RAM must be 32 bits wide. Fine. If you browse thru
>hy>catalogs for memory suppliers, you will occasionally find 2 MB
>hy>SIMMs. You could use 4 of these to provide 8 MB of RAM, assuming
>hy>your board handled 2 MB SIMMs properly.
>
>Sounds promising.

...but it doesn't work - for the same reason why eight 1 MB SIMMs don't.
2 MB SIMMs carry 2 banks of 256 KBit x 36, which is 32 bit plus parity
checking.

One COULD though design a Falcon RAM expansion board that carries one single
72-pin SIMM holding either 1 MBit x 36 (4 MByte) or 4 MBit x 36 (14 MByte).

2 and 8 MByte SIMMs all have two banks of memory and are no use for Falcons.
Only 1, 4, or 16 MByte 72-pin SIMMs were usable, IF there was a board to stick
one of them onto.

bye, Peter

590. make , MiNT 1.08, mintvers, and cursor

Newsgroup: comp.sys.atari.st
Date: 1994-04-12 19:40:43 UTC
From: jaszcz@dewey.EEAP.CWRU.Edu
Message-ID: <2oetfr$7c0@usenet.INS.CWRU.Edu>
Source record: 189309

sorry for the erratic topic... here's the story... it sounds lame, I know.

i was using mint .95 for a while, but then i wanted shareable programs, so
i compiled v.96. the shareable stuff like tcsh works... loads really nicely
but, when i list the processes on the system, the shared copies of tcsh are
still just as big as the original one... is this true or it just looks like it?

with the coming of v.96, mgr stopped working... bummer... so, i thought, i'll
get the latest version (or the latest ftp-able version) and maybe that will
be fixed... so i get the 1.08 version. great!... i try to compile and now
the story is that make doesn't want to work... hmm... it doesn't pull the
PATH environment variable at all, so i had to put absolute paths in all the
program names??? why is that??

next, i found out that i didn't have yacc on my system, so i found the bison
clone... i put it in the /usr/bin directory, and then i had a great idea of
symbolically linking bison.ttp to yacc.ttp, so that it would run bison instead
of yacc ... ln -s bison.ttp yacc.ttp returns "invalid function"... what??
you mean i can't make symbolic links in minix???

next, i looked at the makefile again, and found that eric has commented-out
the bison stuff, so i changed it and finally the damn thing compiled... wow!
i run the system.. nice new load text, etc... but it stole the damn cursor!
now i have no cursor, and i don't know what else isn't working... are these
new versions bug fixes or sabotage?

finally, mintvers reports mint version 1.8... what??!

oh, by the way, when is that pathetic atari company going to let people use
their new aes... mint reports that it is the multitos kernal, so where is
the new aes? (sorry.. i'm just mad at the whole thing) but, when are they
going to get serious and give us the new aes? why the hell not? (american
attitude!)

Hi Daron,
OK, I'll have a look at this. I did try to group them keeping
options that deal with certain areas together like Search/Next/Previous and
Set/Goto/Load/Save Bookmarks etc... maybe I'll put in seperators in the menu
so that it'll be a little clearer. There's a new beta(04) with MaTzY at the
moment that you should get, maybe later this week I'll take a look at
the menus.

Regards,

Stu...!

BTW, have you got your Falcon back yet?

Have you checked how much it costs to have something approved and what is involved? How about sending British engineers to Taiwan (or wherever it is they make the Falcon) for starters? The Falcon itself has to be BTAB approved according to British law.

In regards to my earlier post about the screendump XBIOS(20) call not working properly on the Falcon, I've found out it only fails in ST Low Resolution mode. ST High and Medium res work fine as I thought. Since I never program apps in ST Low, I didn't know about the screendump failure in that resolution.

Does anyone have a routine that could be incorporated that WILL do a standard screendump in ST Low on a Falcon? My friend is using GFA so that's preferred but of course C or Assembly executable is OK as that can be embedded.

Thanks!

-Hutch- @ Fair Dinkum Tech

Hi..though this question really should be in newusers :-) generally what happens after a certain period (roughly 3-4 weeks) of RFD a neutral party will do the vote count, people send him the the YES or NO votes and then we will know...the requirements have to be +100 Yes and no more than 1/3 of YES votes be NO.

It will be explained in more detail when the time comes..which shouldn't be too long.

Cheers

Yat

I know others say 'get the latest version of the MiNT libraries', and'get
the latest version of GCC', but myself, I still have some problems with
these.

So anyways, in any makefile, I always add the -mint switch to the
CFLAGS line. Works fine for me.

Processor Direct Magazine: Further information

For general information please refer to the earlier posted general release.

The text below was used for internal purposes, however due to a very surprising demand, I looked over it and decided to post it. The "Includes" sections don't necessarily mean those are the only illustrations on the page. Don't be fooled by the page numbers. This is quite literally a large magazine (the page size is 11.5"x13.5") and as such the number of pages articles take up is much less. The fact we used slightly smaller text than other publications (it's a 10 point serif font, larger than newspaper but smaller than what would normally be used in a "small" publication) also compressed the size of the issue somewhat. Ask anyone who has seen it, this issue is PACKED.

March/April 1994 Issue Contents:

Page Article name, author : column title

>What programms are there to control the cd rom drives in order to
>play audio tracks?

I use AUD_CD20.ACC

>Is there a programm that reads a config file where one might specify
>what commands are passed to the drive?

If you know the SCSI commands to play audio - then you can program AUD_CD20
to send them.

My config file looks like this:

```
p
10 216 1 1 0 0 0 0 0 0 128
s
6 1 0 0 0 0 0
a
10 218 0 0 0 0 0 0 0 0 0
e
10 217 3 0 0 0 0 0 0 0 128
q
```

Its currently shareware - but just about to go comercial (in the US at
least) apparently.

:-)

>you to do. I mean, if I wanted to FTP *directly* from my Atari
>to an FTP site, would this allow me to do so? If so, how would I need
>to be connected into the net in the first place?

MiNT-Net is the start of an implementation of the Berkley UNIX networking system (typified by Berkley 'sockets' - which are software 'sockets' you connect together to pass information between programs/machines)

The current release version 0.30 is still in the early stages and AFAIK not suitable for proper internet access (no proper FTP for a start).

The other internet access program in common use is KA9Q. This is a simple internet node setup which normally connects into the internet proper over a modem line. The main problem is finding somewhere to dial into. In the UK Demon Internet Sevices sell a widely used connect service with which KA9Q is suitable to use. As for the rest of the world I don't know.

The main reason for interest in MiNT-Net is that its potential is far more than KA9Q, especially for applications in networking 2 or more ST or other machines together.

Anyway I hope that all makes sense. I'm just a user of these 2 packages - not anything to do with writing or porting them.

:-)

Source record: 189326

>I was thinking about this legallity problem. Why don't ATARI produce
>some kind of hardware buffer from the DSP port to a phone connector and
>DSP thruport? With this standard we could have many phone-line applications

Firstly Atari would have to produce 1 for each different style of phone
connector as I don't think the BABP (and the like) would a generic
connector.

Secondly - surely for a modem to be approved - its internal *software*
would also have to be tested to make sure it couldn't send a sequence os
signals which would upset the exchange. If this *is* the case it would seem
that the DSP modem would have to be approved in its entirity.

:-(

Well, it would probably be best for you to go chase down the source code for a RAMdisk then, because having working code will simplify your life a great deal. The RDE program would be a good place to start, since it is freely distributable and comes with source code.

You need to plug into a number of OS vectors; too many for me to recall here at the moment.

On a smiliar similar, has anyone got a RAMdisk that completely emulates a floppy drive? I saw one in the past that partially emulated it, but didn't handle the flop_read or flop_write calls. Would be handy for us folks with single-floppy systems. Also would allow fast production of floppies... (Copy a bunch of files to the RAMdisk, then do a fast sector-copy to the real floppy. Avoid all the slow seeks that would otherwise be needed to update the directory and FAT on a real floppy...)

613. Help: Elite combat techniques.

Newsgroup: comp.sys.atari.st
Date: 1994-04-13 03:26:58 UTC
From: ant@mks.com
Message-ID: <1994Apr13.032658.21899@mks.com>
Source record: 189334

I'm having trouble with manual targeting of ships that I didn't have with the old Elite I.

The only targeting method I've been able to use has been to use Autopilot as a targeting computer for enemy ships. However this technique is not always successful if the other ship proves to be faster that the Autopilot's ability to make course and speed adjustments.

I use the joystick with Elite control option on. I've tried using the keyboard and mouse but find it just as hard to target a ship. I've tried targeting without my engines on and have had no success.

I think the problem is that all the control surfaces are far too sensitive such that the slightest touch of the joystick sends my ship wildly off. Is there a way to reduce the sensitivity of the control surfaces. I've played with using low to high drawing detail by that does not appear to help.

Any suggestions would be welcome.

-ant

BTW, do either of the two blank buttons above and below the joystick control in the options screen do anything?

614. Atari MIDI Software for sale

Newsgroup: comp.sys.atari.st
Date: 1994-04-13 03:53:23 UTC
From: michaelk@pacifier.rain.com
Message-ID: <Co6It2.2G7@pacifier.rain.com>
Source record: 189335
Cross-posted to: rec.music.makers,rec.music.makers.marketplace,rec.music.makers.synth,comp.music,comp.sys.atari.st

I have the following MIDI Software for the Atari-ST / Falcon for sale:

1. Omni-Banker ST patch Librarian (no editing): Last updated in 1991.. this librarian covers many, many synths as well as effects units..... swap patches between banks, copy , delete, etc..provide names for patches for synths like the CZ101 or DW8000. A great organizing program..... $25

2. Dr. T's FX PAC-1, effects processor editing program: This is Caged Artist's software for editing any of the following Effects Processors -- Digitech DSP-128, Yamaha SPX90/SPX90II, Lexicon LXP-1, and the ART Multiverb..... $25

3. Two editing programs for the Korg DW/EX8000 Synth, Synthview by Synergy Resources and Synth Droid by Compu-mates -- both provide full graphic editing and library storage ..... $15 each

4. Dr. T's editor/librarian for the Casio VZ-1/10M synths, also works for the VZ8M - covering the VZ-1/10M features..... $25

5. Dr. T's Phantom software and hardware for SMPTE/ syncing to tape handles also FSK and CLICK (for Atari-ST series only)..... $70

Buyer pays shipping costs, all software comes with original manuals.

623. [HELP] Falcon Bugs (VT52)??

Newsgroup: comp.sys.atari.st
Date: 1994-04-13 07:23:39 UTC
From: jhh@cwi.nl
Message-ID: <Co6sJF.5qy@cwi.nl>
Source record: 189345
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Are there any patches for the following three bugs?

1. The VT52 Escape sequences "\033j" for save position and "\033k" for restore position do not seem to work. Whatever I do, restore position puts me at (0,0) = (upper-left). According to the documentation it is only allowed to do so if no position was saved previously.

2. If lines longer than the width of the screen are being output by a command executed from Gulam, each spillover character is output on single line like
t
h
i
s
.
This happens when I boot my Falcon without MultiTos running.

3. If I do use MultiTos, and want to show a file with VIEWER.APP, I get an empty window with the VIEWER-icon in the middle and a transparent window status line (i.e. the line just below the window title). Clicking the scrollbars sometimes shows me part of the text to be shown, but with truncated characters. It seems as if VIEWER.APP thinks the upper-left corner of its window is always located at the upper-left corner, because if I move the window to that position it will show me most of the text (provided I scroll it first).

I have a 4Mb/85Mb TOS 4.01 Falcon with SVGA, usually operating in 16 colour mode, and FPATCH2 installed.

Thanks,

Jaap-Henk

624. Status of DSP Modem

Newsgroup: comp.sys.atari.st
Date: 1994-04-13 07:27:28 UTC
From: andrew@minster.york.ac.uk
Message-ID: <766222048.219@minster.york.ac.uk>
Source record: 189346

Why isn't atari or some third party company developing a standard
connector from the DSP port to the telephone lines? This could
get legal approval from the telephone company and many future applications
could use it.
It would only have to be the buffering hardware and some control
logic to ensure that signals in and out of the DSP port correctly
went down the 'phone line. It might even be a DSP thru-port that
filters off signals directed at the phone output.

There is no documentation for the library, which might be a problem.

Also, E_GEM programs (inc. LZHSHELL 2.99) tend to override any changes
the user makes to the .RSC files (eg changing colours), which is not
good practice.

From: oberle@informatik.uni-koblenz.de
Message-ID: <2ogaae$17k@newshost.uni-koblenz.de>
Source record: 189452

Generally, if you want to transfer files as quickly as possible,
the best way is the "Kobold" file copy program. With this software,
files aren't copied seperately, but "all in one" (I don't want
to explain it more detailed here).

If you use one of the alternative desktops Gemini 1.99 or Ease 3.0
and if you have Kobold >=2.0, you can even configure the desktop
to use Kobold and not GEMDOS operations to copy/delete/move files.
That way, you don't need to start a separate program to get a maximum
transfer speed.

Kobold is also able to interpret own batch files. Ex.: an automatic
backup of all *.c-files on partition D:.

So this program contains new GEMDOS routines and also replaces a file
copy, a disk copy and a backup program.

I just don't know whether there is an english version or if it is
available at all outside Germany.

Hi,

Cannon Fodder is out for Atari-ST. I've got a demeo-Version of it last week in London. It works on Atari-ST and Falcon with Backward installed.

Great game! Go out and buy it! I have a lot of fun with only the four demo-level.

Tschau,

/Martin/

633. NFS for MiNT released

Newsgroup: comp.sys.atari.st
Date: 1994-04-13 09:27:55 UTC
From: kuehn@math.uni-muenster.de
Message-ID: <2ogdurINNkmm@tarsky.uni-muenster.de>
Source record: 189456

Hi!

I just released my implementation of a SUN-NFS compatible networking filesystem for MiNT. You can find it on ftp.uni-muenster.de in pub/atari/Mint/Network/nfs-042.tar.gz and should also show up on atari.archive very soon.

This package requires the installation of Kay Roemers Socket interface for MiNT in a version >= 0.30, so you might want to get that, too.

It also contains an nfs server, and an nfs mount program.

Just try it, it's fun :)

Ulrich

634. Mega ST vs STE

Newsgroup: comp.sys.atari.st
Date: 1994-04-13 09:29:08 UTC
From: Bales_N@CIRAD.fr
Message-ID: <9404131612.AF00155@montp.cirad.fr>
Source record: 189457

CEO file contents:

I've got an old 520ST with a single sided disk that I'm going to get rid of :(

Just to get myself either a Mega ST or a 1040STE for ~$160 :)

Which do you guys think is the best. I know the STE has a newer sound chip
and better graphics, but Mega ST has a better keyboard (I do quite a bit of
word processing) and looks good.

Can the Mega's RAM be as easily upgraded as the STE's ? What about Hard Drives
or 1.44Mb floppies ?

So long folks...

*** VARIOUS ST ITEMS WANTED ***

I am looking to buy the following Atari ST items:

Original Mega w/4Mb's RAM, TOS 1.04, good working condition. Original packaging a plus as well as a socketed CPU. Plain vanilla please.

JVC SC1224. The "classic" Atari color monitor with the two-tone front bezel, flush, rectangular power switch and round power LED. Not the "Mega" style.

6-chip TOS 1.04 set.

2-chip TOS 1.04 set.

Please E-mail me your best price including shipping to Venice, CA.

Thanks,

Dom

: |>
: Well, at the moment, the mint-net package contains "only" drivers for serial
: and parallel lines. But if you have some connection to the internet by some
: way it is possible to run ftp on your atari at home :-)

I'm afraid, that i have to tell you, that this is not quite right.
With the actual Version 0.3 of Kay's Mint-Net, it is definitly NOT possible
"to run ftp on your atari at home", because there is no support for
TCP clients/servers yet. The UDP based "tftp" should work, but i think this
is not an acceptable substitute for ftp, if you have Internet access.
I tried some tools using UDP Protocol on my ST with a slip connection to
the Internet. They seem to work quite ok. But this tools didn't need to handle
very much Data (i.e. "hostlookup" or "ping"). I also compiled FSP (an UDP
based FTP) for MiNT three days ago. Although the client seems to work, i
couldn't manage to get a file transferred yet. This still could be an error
in the client or my setup. Perhaps it's because the Net in Germany is
often terribly slow. But I'm afraid, that there are still some Bugs in
the socket libs and/or the SLIP driver.
Anyway, I think all "Atari-Freaks" should give a big thanx to Kay for his
excellent work. There should be a more or less full implementation of TCP/IP
for Atari's in the near future.
(BTW: I wonder, why it has needed so long, that someone started to port/write
TCP/IP Soft for the ST)

JR> Hard&Soft's come to mind).

What do you mean exactly? ICD's AdSCSI makes a SCSI CD-ROM have an
ACSI port (the IDs have to be less than 8). As such MetaDOS 2.3
permits me to access my CD-ROM drive. Also, I use ICD's *old*
ICDCDROM.BOS driver for whatever it is worth.

You're probably thinking about MAXIDISK (available at
atari.archive.umich.edu, etc), which is what I use. The compression
won't do you much for pre-compressed stuff (like LZHs or GIFs) but
for uncompressed stuff, you can fit sometimes like 1500k on a 1000k
ramdisk. It's transparent, and does a nice job...

There is a good chance that forthcoming demos will run on VGA and RGB, even with hardware like Screenblaster installed.
The solution is a small software developed by Aura/Mugwumps. I have been able to generate a TC resolution with 320x200 at 50 frames. Exactly what demo coders want!!! It can also produce resolutions like 256x256 in TC or any you like!!!

They'll never do it; 20k machines isn't enough to justify the time
needed, even if _every_ Falcon owner bought a copy.

> Was DOOM originally developed on a NeXT or under NeXT Step/PC? .. If it was on
> a NeXT (68030+56001) they should have most of the code already.

NeXT machines are all 68030 or 68040; only the rare NeXTdimension had
the DSP (as well as an Intel i860). There's almost no chance of DOOM
for NeXT using the DSP.

From one post of id's, I thougt they were using NEXTSTEP for Intel on
Dell hardware, but someone else assured me they were using real black
NeXT hardware.

> do an impressive job, but you would realistically be limited to greyscale.

For monochrome systems, there's mgif, which is surprisingly fast, and
does a great job of displaying them. It's about as fast loading a JPEG
as it is loading a GIF!

Sorry to chip away at my reputation as a nay-sayer... ;-)

> There is also the fact that you need a lot of memory to do the job... with

The latest issue of ST format has the demo of cannon-fodder on their disk.
The demo implements 4 complete levels of the game (from trivial to damn near
impossible).

The demo is copy-protected, and does not run on falcon without a little magic.
I managed to get it working using backward 2.52 - I also found out that it
is using timing loops and ignores the blitter: The game speeds up to unplayable
if I put processor to 16Mhz (it still works thought).

The graphics doesn't speed up when you do the same for the blitter.
If the commercial version comes out falcon compatible, I will probably buy it.
Otherwise I won't bother.

653. Unix ands XWin

Newsgroup: comp.sys.atari.st
Date: 1994-04-13 14:29:09 UTC
From: g051@cpcw8.uea.ac.uk
Message-ID: <2ogvjl$t4p@cpca3.uea.ac.uk>
Source record: 189475
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Does anybody out there have Unix and XWin running on their Atari?
How would I go about getting it?

Thanks in advance.

Ian B. g051@uea.ac.uk

654. Serious ST mags

Newsgroup: comp.sys.atari.st

I'd heartily recommend ST Review. IMHO it's now better than ST Applications (still available too).
Even ST Format has got a bit better recently.

If you have trouble finding ST Review, try taking out a subscription. You can normally find STR at larger Smiths and such places.

re: DSP MODEM Development legalities

Just my personal thought but might this not be another one of those areas where "roll it your own" would be the best way. If some kindly hardware guru were to release a set of instructions for building a standard interface that authors could use then it's a whole different matter. I know that in the U.S. unless you personally called the FCC or had a neighbor complain they would have a hard time stopping you. The designer couldn't make much money if any without risking legal problems, but they would sure get a lot of thanks.

I don't know, just a thought...

Pseudo related question, anyone know if it's possible to create a RAMDISK that uses the Drive B handle on the Falcon? Except for the posibility of a SCSI Floppy (doubt I'll buy one) and Floppy Disk to Floppy Disk copying (don't use it, always use HD to FD) it's really a waste of a handle. Would be a nice place to stick a 1 meg ram disk.

ST Review is still published, and is (IMHO) the only reasonably decent
ST mag available in the newsagents (ie excluding ST Applications!)

If you can't find it, ask. The deal STR have is that newsagents only
pay for copies they sell, but most places don't realise this.

I have a big problem. This college close ftp, gopher, veronica all
kind of all common users (me too), so I can't get any atari software
myself.
I heard about uuencode-uudecode system, but I don't have the atari version
to those software but I know that unix systems installed here, It has
them. So my cuestion is : Those unix version could translate the atari
software into a compatible way with my atari system ?
Can anyone send to me those atari versions to uuencode-uudecode ?
Can anyone tell about other way to get those software in a
right way ?
Please I need some help, because I don't have money to get
commercial atari software.

Bales> Which do you guys think is the best. I know the STE has a newer
Bales> sound chip and better graphics, but Mega ST has a better
Bales> keyboard (I do quite a bit of word processing) and looks good.

The Mega keyboard is indeed MUCH better than that of either the ST or STE. However, the MegaSTE has a keyboard whoch is better still! And you CAN hack a mega keyboard to the STE...

Bales> Can the Mega's RAM be as easily upgraded as the STE's ? What
Bales> about Hard Drives or 1.44Mb floppies ?

Neither can use 1.4 meg drives without a special 3rd party kit. If you want 1.44's get a MegaSTE and save yourself the aggrivation!

As for the RAM, the MAX ANY ST or STE (megas included) can use is 4 megs. If the mega ST is a Mega 2, then RAM is a question. It cannot be upgraded with SIMMs and apparently is a pain in the ass to upgrasde any other way. For wordprocessing, though, 2 megs might be adequate. The STE _probably_ uses SIMMs for easy upgrading (some early ones use SIPPs...)

All in all, I'd say get the mega for wordprocessing or get the STE for just about anything else. $160 is a good price for a Mega2ST, a reasonable one for an STE. A MegaSTE would run you into the $400 range at least!

Here's a quick comparison:

1040ST MegaST2 MegaST4 STE MegaSTE

approx cost $100 $180 $220 $180 $400

processor speed 8MHz 8MHz 8MHz 8MHz 16MHz
upgradability good good good good poor

RAM (megs) 1 2 4 1-4 1-4
ram type DRAM DRAM DRAM SIMM/PP SIMM
upgradability fair fair fair good great

TOS 1.0 1.2 1.2 1.6 2.5/2.6 (NOT 1.4!)
(all can be upgraded to 2.6 and SHOULD at least have 1.4!)

keyboard mushy good good mushy great

form factor 1-piece nice nice 1-piece TT-style
box box box

these are my opinions, BTW...

I agree! This would be a GREAT idea! A STANDARD DSP-phone connector
which all future software could use! It SHOULDN'T be too much trouble
to design and build it, right? Anyone want to volunteer?

I was thinking about the same idea for a "standard" roll-your-own
sampling cart for the STs. It would be nice if Soundlab or something
could use a build-it-yourself device for this! The Amigans have one!

I'm not sure this is entirely accurate but if I recall correctly, I think the 68030 is capable of doing move.w MUCH faster than it can do move.l. It is also possible that the calculations required for texture mapping in bitplane mode can be carried out in the DSP. Of course, that is a bit of a long-shot but I think it's wiser to utilise both processors in the machine, esp. when the DSP can do things like MPEGs on the fly. Handling texture mapping should be almost as "simple."

Anyway, I would think that running DOOM on the Falcon wouldn't be all that bad, especially since some people play DOOM on a 386 which isn't all that much different than a 68030. After all, even my poor Mac IIvx can play Pathways Into Darkness at a reasonable speed, and Bungie had to deal with Apple's idea of page flipping (*blek*). I would assume the Falcon is capable, esp. with a coprocessor.

>the falcon is a bad computer, its great! but not at moving data. So dont
>expect to see doom on falcon, lazers of men is about what well get.

Well, the question is, who's going to do the port and then who's going to be nutty enough to optimise it for 68030/DSP combo. There's going to have to be some MAJOR re-working involved in the graphics end.

I think it's called Maxidisk - if I can recall it was also reset proof -
haven't seen it about for a while though so I'm not sure if it's gonna
be compatible with the newer machines (I use to run it on a 520ST (not FM))!

Regards,

Stu...!

AFAIK there never was a proper manual for the final version Caligrapher. I bought it full price when version 2 was current and upgraded to version 3. All I got in the upgrade was a slim upgrade manual - *not* a proper manual rewrite (which I had been hoping for).

Its not a bad document processor though :-)

Roland.

> the Pagestream 3 debacle.

AEO might just be THE way to wake up people, since it is one of the most widely spread Atari-mags in the world.. What upsets me personally a little is, that so (too..) many of use seem to have a very pessimistic, even hostile attitude towards the bird, Atari, everything... It's kind of strange to see programmers arguing about whether F-030 is slow as a worm, or not.. It seems like many Falcon-owners love the bird (like me, and Falconists I know..) - but quite many don't like it at all. Is the situation "hopeless" in the USA? Or why it seems like the "darkest visions" come from there?

All-in-all, people need lots of positive atUtitude - and new, good games.. ;-)
! Some games th{t definitely deserve to be converted to F-030:

- MicroProse Formula One G.P
(simply the best racing sim - and maybe the best-sold ST-game ever?)

- Dungeon Master 2
(it'd be a real _shame_ not to get this..! After DM 1.)

- Secret Weapons of Luftwaffe
(people love good flight-sims. This one's for Amiga, so...)

- Ultima Underworld 2
(ST-players have always been role-players. So: one of the best?)

- SimCity 2
(Great when released years ago. Vol. 2 must be dynamite?)

- Falcon 3
(anyone wondering why..?)

- Flight Simulator (can't remember what the current number is ;-)

There's a package available as shareware on some atari internet sites
called 'D2M'. It's in French, but reasonably simple to use - I don't know
if it has the brush effects you mention. The shareware version is fairly
crippled - you can't save, etc. But it seems to cover most of the formats
you mention.

There is a Ram disk by Double Click, came on the Utils disk, this was/is
commercial, this had the option to save a img of the ram disk, and install it
on boot up....

You can set up this ram disk in many ways tracks/sectors etc, or just size..

There are 3 Programs that I know of that provide hard drive compaction,
2 are German, the AFX/PFX one is on the net...

I have had problems with PFX on some programs and lots of problems with packing
ACC's, I have never tried AFX though, this is the one for data files....

From: rgivan@cix.compulink.co.uk
Message-ID: <Co7z6H.7Js@cix.compulink.co.uk>
Source record: 189162

A long time ago (1987ish) there was a PD text file that explained how to connect a DEC LK201 keyboard (at least I think thats the model number) to an ST.

I now have the opportunity to obtain such a keyboard - but can't find the text file! I have a feeling I've seen it somewhere recently (ftp site?, GEMini CD?) - but can't find it now :-(

Any ideas anybody?

Thanks

Roland.

It runs very well on my 040 cube... I'm pretty sure that it also runs on the 68030 machines, knowing the NeXT market. The only difference from the PC version (except for the fact that it runs in a window) is that it still lacks sound support, which is a shame.

That has been a figure banded about for a few years now, but from I have seen here most of those machines would be in peoples basements and are not being used, people just got fed up with no support...

To support this just have a look at the New Games that are comming out for the Atari, allmost zero, if there is no market there are no games, simple facts...

I suggest you get a clue before you hit your Flame key next time; in
comp.sys.powerpc, there was an announcement of IBM PowerPersonal
Systems' future systems. They were PPC-601 based and had PCMCIA slots.
The way IBM works (thanks to previous anti-trust suits) they can't
annouce something until it's almost ready to ship.

PReP machines will be able to run any of several operating systems,
including Workplace OS (aka OS/2 on PowerPC), Solaris, AIX, WindowsNT.

I've been seeing a lot of posts about CD ROM and drivers, but I haven't seen anyone mention ExtenDOS from Anodyne Software. Is noone aware of thid great CD-ROM driver software. I have running my AppleCD and it works great! Only problem is that paths get messed up with Geneva and programs can't find their resource file unless it is on the root drive. However, Roger Burrows the author has already indicated he has a fix and is just checking with Gribniff to be sure it will work with future versions of Geneva.

I also just received a flyer from It's All Relative and they are selling a CD Audio player that runs on all Atari's and supports all CD ROM drives with audio out. It will also route the audio into the Falcon and pipe to audio out and you can also manipulate it with software like Audio Fun Machine.

If interested, here's the details

ExtenDOS is $19.95 from It's all Relative or Anodyne Software.
CD Audio Player is $29.99 from It's all Relative ($10.00 if you own another product from them).

I've seen a number of people complain about this problem in version 2.5 (and 2.4 for that matter) but oddly enough I have not come across that problem. (I'm using a 1 meg 1040ST w/ TOS 1.02, though another friend of mine has a similar system -- a 1040STF w/ TOS 1.02 and 1 meg of RAM -- and he HAS experienced the problem)

All I can suggest is that maybe ST-Zip doesn't like one or more of your AUTO programs or accessories...

Just thought I'd let you know, but if you put the Falcon into HOG mode (i.e. partially disable BLiTTER) you can move 12MB/sec and still retain around 90% of the BLiTTER's capabilities.

That works out to 240k/vbl (in PAL mode).

>.bl

Not to detract from all this telepathic discussion, but I guess I've got
some Atari ST MIDI software for sale. Granted it's >3 years old, so I
don't know if there's compatibility issues or not, but here goes:

* Kurzweil 1000 Series Object Mover -- Object (i.e. Patch) librarian
for the Kurzwel 1000 series of sample playback units.

* MT-32 Capture! -- MT-32 editor, programmer, librarian by MIDI Mouse.
includes D50->MT32 and D10->MT32 patch coverters.

Please make any offer you feel. I've not had an Atari ST for many years, so
these don't do much for me now. All original disks, manuals included.

The Computer Science Department at our local university donated 8 ST's
to my elementary school. The only software that came with the machines
was BASIC and some Compilers. We also were given a laser printer and
several hard drives. The problem is that there is no place to buy
software for these machines. Is there a site to get shareware?
Are these machines just old junk? Are there telecommunications and
word processing programs for these?
I hate to see these computers locked in a closet, but noone knows what
to do with them. Our school is predominantly Macintosh. Can these be put
on the ethernet network or used to dial into the internet?

Any suggestions will be graciously received and welcomed.

: bought it full price when version 2 was current and upgraded to version
: 3. All I got in the upgrade was a slim upgrade manual - *not* a proper
: manual rewrite (which I had been hoping for).

Indeed, My complaint is that St Review never passed on the little 20
(?) page booklet to which you are referring!

I don't expect all the bells & whistles straight off the Cover Disk
but when I pay specially to have, what is meant to be the full, upgrade
I >>do<< expect all the documentation - not just the 200+ page ring
bound manual but also the release notes!

Come on St Review do your stuff!

: Its not a bad document processor though :-)

Indeed - a pity Working Title did not carry on and support it and iron out
the few remaining bugs.

Heh heh.

> Which do you guys think is the best. I know the STE has a newer sound chip
> and better graphics, but Mega ST has a better keyboard (I do quite a bit of
> word processing) and looks good.

I own one of each, and I love them both dearly. :) I replaced the funny little rubber thingies inside the STe's keyboard with a somewhat firmer version, and they keyboard now feel fine to me. As for ``looking good'', I don't choose computers for their looks... I actually like the unfashionable all-in-one design of the ST[e,FM]/Falcon, it means I only have one thing to carry from my MIDI-infested loft to the living room when I feel the need for a session of Llamatron. 8^>

> Can the Mega's RAM be as easily upgraded as the STE's ? What about Hard Drives
> or 1.44Mb floppies ?

No. The STe takes SIMMS, cheap, dead easy to install (even I got it right first time). I made a point of getting a (2nd hand) Mega ST with 4 MB of factory-installed memory, as I seem to remember reading quite a few stories about malfunctioning memeory extensions.

At one time I had the STe in a Lighthouse tower with a 300 MB Seagate disc, and experienced no problems. Now the Mega has supplanted the STe in the tower, and also runs fault-free with the same disc. This with GEsoft driver and adapter cannibalised from a 48 MB drive which died.

I recently attempted to upgrade the Mega floppy to 1.44 MB using a conversion kit supplied by ATIN of Holland and installed partly by them, partly by me. It doesn't work :(, which is almost certainly my fault. Must get that fixed some time (some time when I can miss my Mega for a day or two). I have an ED (2.88 MB !!!) conversion kit for the STe which has never been installed because there is no room for it now that the STe is back in its clamshell (see below).

The memory question aside, when both are in their original housings a Mega is easier to upgrade than an STe for simple reasons of physical space. Plus the expansion port on the Mega makes it extra easy to install a graphics card and/or accelerator. That didn't stop me from cramming a 1024x1024 monochrome graphics card and TOS 2.06 into my STe, mind you: and who knows, maybe I will find room for that ED adapter somewhere in the long run.

How does this relate to MintNet (MiNTnet???)? I am in danger of becoming
badly confused.

I am seriously interested in networking my Atari-infested residence, and
would very much like to hear about others' experience in this area.

There will never be a good demo or game which is VGA compatible .. there is a very good reason for this, and it's just to accept that either you need to buy a good MultiScan monitor (down to 15kHz) or a cheap 14" TV which you can switch to when it's demo-time ..

>(still available too).
I definitely agree, ST Apps is getting more and more content-free by the
month, and ST Review is getting better. I wish they'd drop the cover
disk, though. Especially as they keep giving away things that are not
Falcon-compatible (Timeworks, Calligrapher, etc).

>If you have trouble finding ST Review, try taking out a subscription. You can
>normally find STR at larger Smiths and such places.
Or just ask your local newsagent to put it back for you. He's not likely
to get it for display as it's not SOR.

|> software for these machines. Is there a site to get shareware?
|> Are these machines just old junk?
Junk? far from it! There are loadsof FTP sites and quite a few US mailorder dealers who sell stuff. Depending on what you want to do, you may be surprised at the quality of the ST software. Some will give your Macs a run for their money.

Try FTPing to src.doc.ic.ac.uk which has mirrors of a couple of good ST sites. Check in computing/systems/atari. There is also a irregular posting here of other FTP sites.

Tell us what kind of software you want and we can make recommendations.

I am selling the following:

AKAI PEQ-6: 6 channels of 7 band, programmable EQ with MIDI.
Single rack space. $325

BOSS DIMENSION C - beautiful smooth 'SPACE CHORUS'. $100

CASIO FZ-20m rack-mount SAMPLER. 16 bit. Analog filters.
SCSI interface. 8 outputs. Built in graphical editing.
Huge library. $1100

CASIO MG-510 MIDI GUITAR with case. Excellent condition. $400

CASIO VZ-8m. 64 oscillator synth module (with some of my best patches) single
rack space. Keyboard/Guitar/Wind controller modes. $250

EMG 81 Humbucking guitar PICKUPS. 1 pair w/controls. $100

E-mu Proformance-1+ piano/organ/bass/vibes module with
enhanced fidelity output modification. $300

Fostex 460 MULTITRACK CASSETTE WITH 8ch MIXER.
Mixer features parametric EQ, mic preamp w/phantom power
on each channel. List price was $2795, sell for $900

Fostex 2016 16ch or dual 8ch MIXER. Rack mount (2 spaces). $300

KAWAI K-5m additive synth module w/100s of patches. $450

Ovation Preacher solid body electric GUITAR. Mahogany/Gold.$400

POWER AMP. Dual mono construction. Channels matched component
by component to within 0.1% tolerance.
Ideal for studio monitoring. 130 w/ch. $400

SUPRA 2400 baud MODEM. Mint. Box, docs, etc $30

The prices are somewhat negotiable.
Please leave mail or call Chuck @ (612) 872-6698 (voice).
Thanks for reading!

I used to run it on my 1040STE (dated 1991) when I didn't have a harddisk
to store the complete Heat and Serve C compiler. I only allocated 600 KB
for that and there was still free space for my sources. (OK, not more than
a mere 60 KB...) And yes, it is reset proof. That's very handy when coding
demo's or something like that. Assembler and sources in the RAMdisk and
code on! If it crashes the computer, just press reset and within a few
seconds you're back in the editor again!

Is there a GIF slideshow program available for the Falcon
(preferably one that will scale large GIFs down to the
current resolution) or has no one been able to do that in
the 1 1/2 years the Falcon030's been out?

I know there's a few programs that will DISPLAY GIFs, but
I'm talking about a slideshow program that will automatically
cycle through pictures.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have been told the way to go is Mag!cs or what ever its called..

How does this stack up with Geneva, compatiblity with older software,
how much ram used etc...

What sort of support will I get here in New Zealand, and what will it cost me..

Can I buy it by Credit Card, etc..??

The other things are what type of DeskTop shell will I need, Please don't say
Gemini, I am fed up with half baked Translation of German programs, plus
I have never liked Gemini...

I still use Neodesk, will it work 100% with it and support all its features..??

No I don't wish to spash out hard earnt money just to fing I have been conned
like I have with Auto Overscan, with no support..

There is very little support for most German programs out side Germany,
so who will support Mag!cs...???

If its a good USA firm it will get my 100% attention, but if not silch...

I have yet to find a UK firm that support there users, or does not go belly
up..

With Neodesk and Geneva I get full support on GEnie, were would the update
support come for Mag!cs..??

A BBS may be, like GRSRZ has or even GEnie, or even a good FTP site, that
works like GSZRZ does.....??

All food for thought...???

Can any one answer these questions..??

About the blitter!

The Blitter on atari falcon is only about 1,5 times faster than the ste blitter, due to 16Mhz. And this means that it is faster to move with the 68030 instead. The only use you can have with the blitter is when you do calculations in the 68030 , that doesn't need the memory access. You can of course not use the blitter and 68030 on the memory at the same time.
You can put the blitter in (HOG?) mode so the processor gets 64 cycles and the blitter 64 and so on. (I think it was 64) This is good ,for example, starting a 68030 command and then the blitter can put data at the same time. Therfore i do not understand how you got the 240kb/vbl. The 68030 can move at maximum 68400 kb/vbl data to the memory ()+,and ca:136000kb/vbl of the same data(like d0) to for example clear the screen. I may be wrong , but i doubt it. Therefore the blitter is in my opinion(Hmm. opinion) nearly useless.

Well any comment!
Bye for now.

I only had a quick look at it, someone else is writing the review. All I
can say is that I wasn't impressed with the way it looked.

Try this out :-) if you can get the STFormat Cover Disk of Prism Paint 1.1
which was released..then upgrade to Prism Paint 2.0 and it should be under
100U$D (at least in the U.S.A.) *grin*, it does pretty much most of the
features up there....there is a demo on ftp.std.com or a.a.u.e

Cheers

727. REPOST Atari Midi Software for sale

Newsgroup: comp.sys.atari.st
Date: 1994-04-14 17:26:41 UTC
From: michaelk@pacifier.rain.com
Message-ID: <Co9F4K.BG@pacifier.rain.com>
Source record: 189198
Cross-posted to: rec.music.makers.marketplace,comp.sys.atari.st,rec.music.makers.synth

I have the following MIDI Software for the Atari-ST / Falcon for sale:

1. Omni-Banker ST patch Librarian (no editing): Last updated in 1991.. this librarian covers many, many synths as well as effects units..... swap patches between banks, copy , delete, etc..provide names for patches for synths like the CZ101 or DW8000. A great organizing program..... $25

2. Dr. T's FX PAC-1, effects processor editing program: This is Caged Artist's software for editing any of the following Effects Processors -- Digitech DSP-128, Yamaha SPX90/SPX90II, Lexicon LXP-1, and the ART Multiverb..... $25

3. Two editing programs for the Korg DW/EX8000 Synth, Synthview by Synergy Resources and Synth Droid by Compu-mates -- both provide full graphic editing and library storage ..... $15 each

4. Dr. T's editor/librarian for the Casio VZ-1/10M synths, also works for the VZ8M - covering the VZ-1/10M features..... $25

5. Dr. T's Phantom software and hardware for SMPTE/ syncing to tape handles also FSK and CLICK (for Atari-ST series only)..... $70

Buyer pays shipping costs, all software comes with original manuals.

I just wanted to know if there existed an unformat utility for ST.
The case is a friend with an atari begun to format a disk and stopped after a
short lap of time.
He wants to know if there is a way to recover his datas.

Thanks in advance.

Yep, tried out beta4 last night, working perfectly as usual, no problems
there. Got scared off a little by the sound settings though, looks a bit
complex. Also can it handle raw AVR files?

>BTW, have you got your Falcon back yet?

Yep thank god, and fully operational.

BC> to generate a TC resolution with 320x200 at 50 frames. Exactly what demo

Right, about 10% of all VGA monitors will handle that, if not less, and it's NOT a cure for the fact that a VGA screen updates at 31.5kHz and WON'T do TC resolutions above 480 pixels horisontally, and many demos use 768*576 TC ..

732. SLIP FAQ

Newsgroup: comp.sys.atari.st
Date: 1994-04-14 18:34:26 UTC
From: dackerma@magnus.acs.ohio-state.edu
Message-ID: <199404141834.OAA04363@beauty.magnus.acs.ohio-state.edu>
Source record: 189104
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Well my Falcon is down for repairs, so I find myself with a litle free time. So I've decided to try to put it to some use.

I am looking for submissions, sugestions or pointers for a SLIP FAQ for the Atari 16/32 bit computers. I am fairly fluent in both french and german so if you don't feel comfortable with english, you can use one of these. I would also be interested in people willing to do a translation of this FAQ to their native language.

So PLEASE, if you have any info on software, tips, tricks or etc. Please mail me and let me know. If you are a (semi)expert on this please mail me and make yourself available for stupid questions. Remember stupid questions you answer now are ones you can avoid in the future. Hopefully we can come up with something that will be helpful to all.

Thanks,

Dan Ackerman
ackerman.29@osu.edu

733. Re: Cart of Cubase3.1 works with Cubase Audio?? Info requested

Cubase Audio Falcon has a new Protection-Key which is different from
Cubase V3.1. A SCSI-2 HDD must be used for recording and playback of
digital audio; it must have at least an average seek of 14ms or better
for playback of 8 tracks of digital audio. As such, the internal IDE HDD
cannot be used for recording and playback. Cubase Audio Falcon needs a
minimum of 4MB of RAM to run and record/playback of 4 tracks (or is it 2
tracks) of digital audio. But frankly speaking, 14MB will be the most
ideal environment. There is an optional hardware called FDI (Falcon
Digital Interface) which has a digital input and a output in coaxial and
optical form for you to interface to DAT recorders or D/A converters.
With this hardware, you can also stream (that is, backup) your audio
files (or any other computer files) to DAT recorder. Software is included
for backing-up and restoring files.

mforget@elfhaven.ersys.edmonton.ab.ca writes:

[...bit about The RDD3 removed...]
[...bit about MasterBrowse removed...]

Hi Michel,
Competition only improves the quality of software that's
available for the ST and this can only be a good thing for the whole
ST community. I think really that we're aiming our products at very
different user bases, MasterBrowse is without doubt the best GEM based
viewer on the market, and I like to think that the RDD is the best
non-GEM viewer.... hence people who like a GEM environment would probably
choose MB, the others the RDD. One thing that I think I can say without
causing a huge flame-war is that the RDD is probably the fastest due to
the fact it's not using GEM but it's own highly optimized routines.

Regards,

Stu...!

735. FirstWordPlus to Word?

Newsgroup: comp.sys.atari.st
Date: 1994-04-14 19:45:29 UTC
From: lefranc@lsh01.univ-lille1.fr
Message-ID: <2ok6gp$nq7@netserver.univ-lille1.fr>
Source record: 189113

Hi all !

I would like to know, if that exists, a ftp site where one can find
utilities to convert .DOC files created by First Word Plus to
files Word for Mac can understand (i.e. Word files (fine!), RTF,
or even plain text).

Thank you very much in advance.

736. Offline newsreader

Newsgroup: comp.sys.atari.st
Date: 1994-04-14 19:47:40 UTC
From: Gard Eggesboe Abrahamsen <ga@samson.mrih.no>
Message-ID: <2ok34e$a50@trane.uninett.no>
Source record: 189108

I am currently rushing through all the unread articles of c.s.a.s, (I haven't taken the time to read much these days - been working on my offline newsreader) and find this discussion on offline newsreaders. Well, here's the one I use; Ketchup (Catchup)

The variable CUPATH tells Catchup where to do the works. If CUPATH doesn't exist, then HOME will be used.

CUPATH/.subscription is your subscription file. This one has the format;

news.group 0
comp.sys.atari.st 24892

and so on. The numbers behind the newsgroups are the numbers of the last read article in that group.

Starting catchup without any switches, articles will be appended to the files

CUPATH/news.group
CUPATH/comp.sys.atari.st

and so on, in the typical mail format. I, myself, like to have CUPATH set to ~/mail, so that I can then use PINE to read the news with. Unless, of course, if I am on holiday, in which case I use the following line.

half an hour before I log on:

ketchup -c | gzip -c > newnews.gz

I the just download the newnews.gz file with Z-modem, unzip it locally and voila... ;-) Enjoy!

Gard Eggesboe Abrahamsen ||| Phone: (+47) 7015 5497 "Flush twice, it's
PO Box 5061, Larsgaarden ||| Gard.Abrahamsen@mrih.no a long way to the
6021 Aalesund, Norway / | \ finger ga@samson.mrih.no cafeteria" (ST:TNG)
Disclaimer: No, these are not the views of MRIH. They haven't thought of them.
----------------8<----------Cut---
/* ketchup.c */
/*

Catchup v2.1 NNTP Newsreader - downloads all unread news and store them in files. Needs file...
$CUPATH/.subscription or $HOME/.subscription if CUPATH is undefined has the form:

first.news.group 0
second.news.group 0
third.news.group 0

```
fourth.news.group 0

The numbers indicate last read article.

This program is postcardware. Please send a postcard to...

>like a fully optimised code to me.

I don't know how much real programming you have done, Rickard, but in
real life situations, with real deadlines and big money at stake, it is
more or less pointless to write all code in assembly. In many programs a
very small part does most of the work, and thus you are best off optimizing
that part as much as possible, with the rest of the code written in some
high-level language.

The programmers of DOOM aren't blockheads, and you as an Atari fanatic
should be grateful that a large part of DOOM is written in C, since that
means the porting to the Jaguar is faster than it would ever have been
if all of it had been written in 80x86 assembly.

Moreover, mature compilers exist for many environments, which generate
code so close to human-generated assembly, that it is close to impossible
to get any sort of measurable improvement on non-intensive program
segments. SAS/C V6.51 for the Amiga and WatCom for the PC for example.
I've no idea how good C compilers are on the Atari, though.

> Drives
> or 1.44Mb floppies ?

The Mega ST has 4, 2, and (very few) 1 meg(s) of RAM. I don't know how the RAM is configured in the one meg version, but in the two meg Mega, there is room to solder on two further megs of RAM. You can fit an internal 3.1/2" Hard Drive, without any problems. Together with the "ICD AdSCSII micro" -card it will fit inside the Mega without any problem.

The STE series do have better sound and GFX, but there isn't all that much software available supporting theese enhancements.

My advice is to buy the Mega, fit an internal Hard Drive, and place the computer under the monitor.

741. 'Miracle' Piano Software for ST?

Newsgroup: comp.sys.atari.st
Date: 1994-04-14 21:12:13 UTC
From: gregk@nskernel.tandem.com
Message-ID: <Co9pKE.9C0@cpd.tandem.com>
Source record: 189115

Hi All,

I recently discovered that the 'Miracle Piano' software is now available without having to purchase the keyboard - any MIDI keyboard should work. And the price was about $79 (for IBM-PC).

Does anyone know if there is a version of this software available for the ST?

Thanks, Greg.

Greg Kilfoyle

You are getting off track here, gentlemen. The original poster asked about an Atari utility similar to 'RAM Doubler' for the Mac. That utilty fools the machine into thinking it has twice as much _RAM_ than it actually does. It has nothing to do with storage.

Fairly clever piece of work, actually. And by all reports, it's compatible with 'most' Mac software. Would be handy to have an Atari utility like this considering the demands of MultiTOS.

>Are these machines just old junk? Are there telecommunications and
>word processing programs for these?

There is plenty of stuff available, you can communicate via very good
terminal shareware packages such as Connect..and you can also use networking
software (in your case via MIDI) to inter-connect all atari's..the only way
to connect an enthernet card is with the tu-wien software (or possibly others)
with the Riebl Karte...and that is expensive...

You can dial in using U-point if you have support for UUCP via remote dialin..

Cheers

Source record: 189123

World:

Thanks again to all of those who gave me a hand with my falcon NVRAM problems. Today I was able to fix them and I've got my system back to normal.

I've learned my lesson! I can no longer assume that newer Atari made monitors (RGB) can handle 50hz PAL reliably. This also explains why I've had problems with all of those Falcon demos and shareware/PD games found on the various FTP sites. Perhaps this summer my Magnavox RGB screen will let me run them or I'll make enough $$ for a nice VGA display.

Thanks and take care!

Ari

They are FALCON only, a demo by LAZER of the Independents, which extracts to
about 6 meg. Well worth it, on of the best demos I've ever seen. Some screens
are brilliant, some lack a little lustre, but well worth having.

BTW It's called "Autowaschen Verboten".

752. Diamond Back 3...

Newsgroup: comp.sys.atari.st
Date: 1994-04-15 02:00:16 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <2oksfg$61v@golem.wcc.govt.nz>
Source record: 189126

Hi you backup freaks, I just found this one GEnie...

Press Release April 12, 1994

Oregon Research is proud to announce a major upgrade to it's premier hard disk backup and restore program. Diamond Back 3 began shipping today. Among the enhancements to Diamond Back are:

* A completely redesigned icon and drop down list driven full windowed user interface.

* New Visual Directory tree interface for backup and restore path selection. Easy point and click selection of paths and files.

* Multiple volume removable media(e.g. Syquest, floptical) support

* Support for ANY SCSI tape drive attached to ACSI, TT SCSI, or Falcon SCSI-2 ports.

* Custom Backup configurations saved with "Human Readable" descriptions that you can remember rather than cryptic 8 character file names

* Backup Logfiles remember EVERYTHING for you. All your backup options and where the files came from. To restore just load a log file and go!

* Multi-Tasking background backups with any version of TOS. Use any event driven ACC while you backup!

* Many more enhancements

Diamond Back 3 retails for $69.95 and is available now. Upgrades from previous versions of Diamond Back are $29 + $4 S&H from now until July 31, 1994 and $34 + $4 S&H thereafter. If you have not sent in your registration card then you will need to send you original disk(or a xerox copy of your original disk) with your upgrade order.

For more information contact us below or download the Diamond Back 3 demo.

>

I've got a 1040STE and my brother has a Mega ST2, so I know something about
it anyway.
Mega Pluses Mega minuses

Detached keyboard Older TOS (unless it's been upgraded)
Expansion slot Mono sound
Easily accessed joystick ports Fewer colors
Easily fits most computer desks No DMA Sound
Memory upgrade sucks

STE Pluses STE minuses

DMA Sound Non detachable keyboard
Stereo sound No expansion slot
More Colors Possible bad DMA chip
Easy RAM upgrades Incompatible with some old games
Stable OS (versus 1.2)
Cooler Demos

```
****************************************
ATTENTION: ALL GAME PLAYERS AND PROGRAMMERS
****************************************

For information on a Beta Test program and Software Developer's
Kit program for a new joystick, please send your email return
address to: sdk@c3i.com

Please indicate which program you want information on.

The joystick has the following features:

o For use on all the following computers and game systems:
(specific cable required)
- IBM PC and compatibles
- Super Nintendo/Super Famicom
- Sega Genesis/Megadrive
- Macintosh with Apple Desktop Bus
- Amiga
- CD32
- Nintendo Entertainment System 8-bit
- Sega Master System
- AppleIIGS
- Atari
- Commodore 64
o Eight-button mode available on all platforms.
o Standard arcade size buttons in a compact arcade style
case.
o High strength steel shaft, with interchangeable handles.
o LCD display for button feedback, game messages, and
programming.
o Five year warranty.
o High precision and sensitivity.
o Special sensor technologies; no contacts to wear out on
primary components.
o Fully programmable.
- Turbo, slow, and custom modes available.
- Adjustable deadzone for rock-steady precision centering.
- Hundreds of presets available for the most popular
games.
o Selectable analog, digital, and other modes.
o Retains settings in non-volatile memory; no batteries
required.

Thank you in advance.
```

Jeremy McDonald
VP of Product Development
C3I Precision Instruments

P.S.
Thank you to all who have already applied for the software developer's kit. The software developer's kit offer remains the same, and due to exceptional demand by game players to take part in a beta test program as well, we have put together the beta test offer.

It doesn't matter how it was written originally. Fact is there is a version
for NeXT machines (680x0 based) - check the NeXT groups.
I guess it would be possible to run the game on the Falcon just like on
the original NeXT - in 4 colour grey scale ;-)

: How would I go about getting it?

I have Minix running on my system....this is not a full implementation of UNIX
as we now know it, but an implementation of and old version of UNIX(v7).
However, it is fine to use, and learn about UNIX with.

There are UNIX tools available for the ST in the public domain, which can be
used with the desktop, but you really need a shell/cli which are also available.
And with MiNT available in the PD too, you have a type of UNIX box in you ST.

As for XWin, someone is supposed to be porting one over......however, some
problems with memory management, and sockets on the plain 68000. There is
supposed to be one available for the ST though, albeit quite expensive. I think
it is mentioned in the hardware FAQ for this newsgroup. The address is also
mentioned.

Hope this helps.

There is a major bug in the Falcon's console output, in that any output wrapping round the end of the last line on the screen causes it to forget to do the carriage return. I haven't used MultiTos much, but if I remember rightly this bug is fixed for it.

As far as I've seen, save/restore cursor still work. Remember, some of the other escape sequences use save/restore, and may disturb stored values. This may also occur if you cause the screen to scroll while the position is saved.

From: mdekker@fwi.uva.nl
Message-ID: <2olje8$435@turing.fwi.uva.nl>
Source record: 189138

Hi,

at the moment I am coding a game using the Heat & Serve C compiler.
last night I got a very weird error. I was writing a routine to handle
redraws. It compiled fine and the executable did all I wanted, except when
terminating, it bombed (4 bombs). Strange. I took a look at the code, and
discovered that I called a function without the parameters (I did something
like rd_board() instead of rd_board(x, y)). I fixed that, but now the
compiler gives the following error:

compiler bug: machine exception : 4 bombs
cannot load/run cc:
range error.

Can someone explain this to me? I understand it is difficult, because you
haven't seen my code, but knowing what this error means can help me.

Geez, Chris, there goes my theory of a stable world ;-)

>> There is also the fact that you need a lot of memory to do the job... with
>> most ST's out there still only 1 Meg, it would be tricky to do any picture of
>> reasonable size.
>
>I've got 4M in my machine, so your mileage may vary with mgif.

I think his point of memory can be taken, depending on the
method used by the picture viewer. Take Gemview for instance - it
tries to create (within the confines of the graphics mode) an exact
display of the picture - so if the display takes up 3megs, then
3 megs for the picture are needed. I've tried a couple JPGs that
had like 1024x768 dimensions, and I had to boot up almost totally
clean to load it into Gemview (this is on a 4meg MSTe)...

On the other hand, there are programs like Mgif and Photochrome,
where it decides how much of the picture to display as it's loading,
so that really the only memory being used is enough to display
a representation of the picture. That is why (at least with
Photochrome) you can load GIFs that are quite large. That is also why
I could view said GIFs on my 8bit some time ago (at least those
I had enough room on the disk for :-)

Speaking of Photochrome, I just downloaded version 4 from GEnie.
It says in the docs that on a MSTe it will automatically switch to
16mhz/cache to load the picture, and back to 8mhz to view it.
Unfortunately, it doesn't seem to do the latter part on my MSTe :-(
It's a TOS 2.06/USA roms system. Anyone have any ideas?

IMHO the best and safest way to improve your harddisk performance is to install Tos 1.04 or higher in your mashine. It gives an overall boost in disk speed.

When I upgraded my first MegaST from 1.02 (Blitter-Tos) to 1.04 and later to KAOS 1.4x, the gain in performance was remarkable.

> How does it work? Does it slave to disk like a mini virtual RAM system or what?

To be honest, I don't really know just how RAMdoubler on the Mac actually works. It is NOT a Virtural Memory design, however. Basically it has to do with the fact that Macs waste a _lot_ of memory in each application. An application may 'need' a total of 2 or 3 Mb to run, but only a portion (like half?) of that is generally needed at one time. Somehow RAMdoubler frees up that unused RAM and redistributes it to the various applications that are running. Keep in mind that System 7 powered Macs multitask by default... you can't turn it off like you could in early System 6 versions.

Like I say, I'm not sure how it was done, but it's a clever hack. Of course, it evidently does have trouble with some apps so it's not perfect. What is?

I'd still like to see this on the Atari, though!

```
FALCON 030 - LIST OF GAMES
==========================

Compiled by Heiko Hartmann
zcam1121@rpool4.rus.uni-stuttgart.de
Last Update: 04/15/94
Titles: 595

-----------------------------------NEWS-----------------------------------
All new entries are marked with a "*" in front of their name! All games
supporting higher resolutions have a "^" in the "C"-row now!
I have added many titles from Richard Karsmakers great ST-News-List!
(Sorry no Backward settings...)
--------------------------------------------------------------------------

ST: Status. "PD" - Public Domain, Freeware, Postcardware etc.
"SH" - Shareware, Dongleware, Poolware etc.
"C1" - Commercial, newer games (full-prize).
"C2" - Commercial, older games (some of them reappeared in
Compilations, others are available as low-budget games,
many of them aren't available any more).

C: Compatiblity. "-" - The game does never run on F030.
"+" - The game runs with ST-Emulators like Backward etc.
"!" - The game runs without modifications (in ST-Low)!
Falcon games and some GEM based games may run in higher
resolutions.
An additional "^" means: Game does also run in higher
resolutions than ST-Low or ST-High!

MHZ: Mhz-rate of 68030 (and Blitter). "8" - 68030 with 8 MHz.
"16" - 68030 with 16 MHz.
This row (and the following) aren't important for games with
Compatibility = "!". These are the switches for the ST-Emulators.

DC: Data cache. "-" - Data cache OFF.
"+" - You can leave the Data cache switched ON.

AC: Adress cache. "-" - Data cache OFF.
"+" - You can leave the Data cache switched ON.

STE: STE-Bus-Mode. "-" - STE-Bus-Mode is not needed.
"+" - STE-Bus-Mode must be switched ON.

SND: Sound. "-" - The game has no sound on F030.
"+" - The game has slightly distorted sound with ST-Emulation.
"!" - No problems with sound on F030.
```

HD?: Harddisk installation?. "+" - The game can be installed on HD.
"-" - HD-Installation is not possible.

A "?" means: unknown.
"*" in front of the name: new entry!
">?<" means: Info maybe wrong (conflicting reports)!

NAME ST C MHZ DC AC STE SND HD?

Statistics:
Games which never run on F030 : 170 28.6 %
```

Games which run with ST-Emulators : 128 21.5 %
Games which run without Modifications: 297 49.9 %
There are 21 games especially done for the Falcon. With a ST-Emulator you
can run 70.4 % of the ST(E)-Games. In reality I expect ~65 %...

Some hints for ST-Emulators:

1.) If you get 2 Bombs, try the STE-Bus-Emulation-Mode.
2.) If you don't get correct sound, try to switch between "Timer A" and
"MFP"-Interrupt. Try "ST-Sound corrected".
3.) If your game is protected and doesn't load properly try to switch off
both caches and switch the CPU to 8 MHz.
4.) In Backward always use "TOS patched" and "STE-Bus-Mode". You have no
disadvantages when using them (well...nearly none).
5.) Set the Bootup-resolution to ST-Low. There are some programs which
allow you to alter the Non-Volatile-RAM of the Falcon.
6.) If you have TOS 4.01 try to get TOS 4.02 from Atari! Some games have
problems with the errors in TOS 4.01.
7.) Known ST-Emulators:
Backward - Lots of switches, nice GEM-Interface, options can be
switched while playing, the best!
Magi-Boot - The first ST-Emulator.
Gamefix - German STE-Emulator ("TOS-Disk"), nice.
VCB - Writes Bootsectors. Switches can be made while playing!
FBoot - Writes Bootsectors. Only Caches ON/OFF, CPU 8/16 MHz.
Falcon SX - ACC which allows to switch CPU 8/16 Mhz and Caches ON/OFF.

Do you have informations about another game? Do you have some corrections
for the list? -> EMail me! This list should be as big as possible and
therefore I need your help!

Please EMail me the following:
NAME: The name of the game.
STATUS: Is it PD, Shareware or Commercial?
COMPATIBILITY: Does it run on the F030? Perhaps with a ST-Emulator?
If a ST-Emulator is needed:
MHZ: Do you have to switch the CPU to 8 MHz?
CACHES: Do you have to switch the caches off?
STE-MODE: Do you have to switch to STE-Bus-Mode?
SOUND: Does the game have the proper sound on F030?
HD: Is it possible to install the game on harddisk?

Remember: All informations are subject to error! No warranty that the
given information is correct! I'm unable to test all the games in the list!

Feel free to spread this list wherever you want! But take care: Commercial
use of this list is prohibited! For example: publishing this list in any

magazine is not allowed (you have to contact me first)!

You can always get the latest copy of this list from:
ftp.uni-kl.de in /pub/atari/falcon, name: f_games_list.zip

Thanks to: Michael Papadopoulos, Thomas Binder, Ari, Kevin Grubb, Victor Bruhn, Andrew Hague, Patrik Sanfridsson, Christian Perle, Brian Baird, Dr. Bruce Noonan, Randall Kopchak, Brian Freeman, Steven Elliot, George Cubra, Meg Schwartz, Dan Ackerman, Jeff Ziolkowski, Ian Hodgson, Graig Graham, Carsten Tolkmit, Frank Doernenburg, Joost van der Leij, Patrik Sanfridsson, Stuart Denman, Warwick Allison, Richard Karsmakers and Jack Kitowicz!

If you have more informations about ST-games or corrections for the list, please EMail me:

I saw it demonstrated in January this year, which is slightly too
early to be an April Fool's joke!

But it's a waste of time, IMHO, as it is incompatible with TOS.

I have been using the Viper in my Mega-2 ST for almost 2 years now. I have an ICD Advantage host adaptor and use the Beckemeyer SCSI Tape backup software. I can backup a little over 100 meg in 30 minutes. I also use a unix type "tar" program to exchange files with my ST and the HP at work. I have never had any problems.

788. Safari Fonts #27 & #28

Newsgroup: comp.sys.atari.st
Date: 1994-04-15 15:12:18 UTC
From: daroloso@math.uwaterloo.ca
Message-ID: <CoB3KI.353@undergrad.math.uwaterloo.ca>
Source record: 189213

I recently purchased Safari Fonts #27
(Atomic Age, Crazy Dazy, Celebrate, Milk Wagon)
and #28
(Fatta, Fatta Sans, Rabbit Ears, Fireworks, Sashimi)
and tried to use the Type 1 fonts in PageStream 2.

Three of the fonts worked fine: Fatta, Fatta Sans, Rabbit Ears.
The others didn't seem to change the Times font I had selected.
I tried editting the files with emacs to correct things such as
missing initial letters in FontName's and apparently missing /'s.
The fonts now show up as blanks and the hexadecimal info does still not
seem to be placed in the PS when printing.

Is this a known problem? Can I fix it or do I need to send my disks
somewhere?
Does anyone have an Internet/Compuserve/GEnie address for Computer Safari?

790. Falcon version of Quartet ???

Newsgroup: comp.sys.atari.st
Date: 1994-04-15 15:18:30 UTC
From: rgibson@cs.strath.ac.uk
Message-ID: <2omb86$s78@dunlop.cs.strath.ac.uk>
Source record: 189274

Hi, I've had Quartet for quite a while of the ST and I've now got a fair amount of music in .4V files.

The thing is, I'm now going to upgrade to a Falcon and I don't want to lose all the music.

I'm wondering if there is going to be a Falcon version of the program (Octet ???) or if there is a program to convert Quartet files to another format which could be used with some sort of sequencer on the Falcon with more than 4 tracks.

Any help appreciated...

Ronnie

There was an article about this in Current Notes some time ago. I _think_
there is a version of ST_Writer (a shareware or freeware ST word processor)
that is set up for Cyrillic word processing.

The ramdisk part of Turtle does exactly this when doing backups.

DCRAMIT.ACC allows it as well -- at least when set to the same sector/track paramters. Interleave is standard unless something non-standard is copied into the ramdisk. A few others (PD and commercial) I've also seen allow it.

I've generally noticed this from NeoDesk, which indicates on disk-copy whether or not a copy operation can proceed by sector or by file.

From: krlawson@freenet.hut.fi
Message-ID: <2omi76$322@freenet.hut.fi>
Source record: 189219

I think it would be an extremely good idea to get Doom for the falcon and I
can probably send a list of about 10 finnish people would like to see the game
made on this machine. If this machine is not capable of running Doom smoothly
then the Falcon sucks (sorry :)) and I am going to buy a 486 66 Mhz (sorry
again). Up untill now I have trsuted the falcon's DSP to be pretty fast so
I expect it to be capable of running Doom easily.

>software for these machines. Is there a site to get shareware?
>Are these machines just old junk? Are there telecommunications and
>word processing programs for these?

For shareware, try atari.archive.umich.edu or GEnie or Delphi or CompuServe
or a number of other FTP sites (the best way to get to aaue is via Gopher,
since the anonymous ftp ports are usually full). For software, either
try mailordering from Toad (800-448-TOAD) or going to ATY Computer in
Oakland (510-something--call directory assistance). There is also a
users group based in Sacramento (although I don't have their name--the users
group list is one or two issues back in Atari Explorer Online, catalogued
on aaue).

In terms of actual software available, for wordprocessing, you can use
WordPerfect (my choice for papers--I export to a DTP), Calligrapher,
AtariWorks (integrated), and any of a whole load of other programs.
As for Comm software, there are a number of good comm packages--PD or
commercial.

>I hate to see these computers locked in a closet, but noone knows what

>on the ethernet network or used to dial into the internet?

Ataris make wonderful Macs (albeit not quite yet running System 7), too.
They aren't that practical for Ethernetting, though, due to the cost of
the cards. Worst case--take one home with you and use it for Llamatron!

>|> You are getting off track here, gentlemen. The original poster asked about
>|> an Atari utility similar to 'RAM Doubler' for the Mac. That utilty fools the
>|> machine into thinking it has twice as much _RAM_ than it actually does. It
>How does it work? Does it slave to disk like a mini virtual RAM system or what?

I tried to post a reply to the original posting when it first appeared, but it never came through, so I'll try again...

From what I've been told by the Mac techs I know (my cousin is running an AppleCenter) the RAMdoubler works its magic with two tricks:

1. Every Mac app has to reserve a given amount of memory for itself. This is seldom filled up all the time and RAMdoubler steals the unused part back to the system, making it appear free. Think about it like this:

You have an 8 meg Mac
The system is using 2 megs
Excel grabs 3 more, but are using only 1 meg at the moment.
Word grabs 3 more megs, but like Excel it's only using 1.

Your mac would normally now be out of memory for other apps. RAMdoubler grabs the 4 megs unused by the running apps and make them available to the system, thus giving you the impression of having 12 megs in total.

2. Mac files and apps have two forks - one resource and one data. When you load an app, the whole thing is stuffed into the area of memory the app has. Now, you normally don't need all the resources at the same time, so RAMdoubler compresses the resource fork and uncompresses the needed resources whenever the app request them. This saves another large amount of RAM to be made available to the system, thus giving you (in total) approximately twice as much RAM as you have physically.

It works great on Macs with smaller amounts of mem (i.e.4-16MB) used for everyday things like word processing etc. They tried to use it on a few Quadra 950's already having 128 and 48MB of RAM respectively. These were used for heavy duty DTP/prepress work, running QuarkXpress and Adobe Photoshop and the likes. *That* didn't work out at all - it just crashed the system.

I doubt the technique could be applied to the TT/Falcon machines (it needs 030 or better), give the way GEM works. Personally, I'm of the opinion that if you need more storage or RAM capacity you should shell out for some more HW... You're bound to get problems someday.

If some better informed Apple techie knows better, speak up. I haven't written that piece of software... :)

>Oh good, just what we need. Another anonymous Atari CRIMINAL in the making!

>Grrrrr.

>-Hutch- @ Fair Dinkum Tech

I feel the same way. I've become very conscientous in the last few
months of paying my shareware fees and supporting commercial
developers. In all cases, these developers work hard to support a
platform the doesn't get recongized very well.

If this type of activity goes on, no one will want to develop for the
ATari platforms and we'll be left with aging equipment and second rate
software.. basically all we'll have is dust.

I definately won't support this hacking/phreaking cause by mailing any
software to that address.. BS!

In non STE's it's easier to install TOS 1.04 (which is the Rainbow-Tos).
For TOS 2.06 you have to do some hardware-fiddling to fit in and access the
MegaBitEproms correctly.

The physical driver (CDARGEN.BOS) in Atari's MetaDOS packages only supports
the SCSI port of the TT (and the ACSI port for the CDAR 504). Read the
readme :-)

806. Spectre 3.0 and CPU accelerators with cache

Newsgroup: comp.sys.atari.st
Date: 1994-04-15 20:20:00 UTC
From: wilko@idca.tds.philips.nl
Message-ID: <778@apdnews.idca.tds.philips.nl>
Source record: 189259
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Has someone around there any experience with using Spectre on
a ST with CPU accelerator AND a cache? I have built the PAK/3
(with 68020/68881 (16Mc) and 32kb cache) from the German magazine C't.

Without the cache SPectre runs like a charm, with the cache on
Spectre upon entering Mac mode hangs the system, leaving a
random bit pattern on the bottom of the screen.

The speed difference is enough to warrant me persuing this further.

Any comments? Maybe Dave's listening again? (Welcome back BTW,
news about Spectre has been missed by a lot of people).

Wilko

807. CD-ROM drive & Supra SCSI interface?

Newsgroup: comp.sys.atari.st
Date: 1994-04-15 20:43:19 UTC
From: selick@acs3.bu.edu
Message-ID: <2omu97$nsr@news.bu.edu>
Source record: 189229

I'm currently trying to hook up a NEC Intersect CD-Rom reader to my 1040 STe tos 1.6 4 megs with a Supra SCSI host adaptor. Should this work? I've got the cd-rom drive on SCSI address 5, and when metados activates the drive, the system hangs for awhile, then goes to the default desktop. Double clicking the C drive gives the response "data on drive c may be damaged...". Without running metados, my regular drives (scsi 0, lun 0 & 1) run fine, so I don't suspect the cable.

Are there other drivers I should know about?

Thanks,
Steve

>How does this relate to MintNet (MiNTnet???)? I am in danger of becoming
>badly confused.

The NFS requires the services that MiNT-Net supplies - in order to
function.

>I am seriously interested in networking my Atari-infested residence, and
>would very much like to hear about others' experience in this area.

Well I've tried a few freeware networking programs for the ST, but not
found anything stable,small and fast enough that works under MTOS. MiNT-Net
(and the NFS) are currently my best new hope as they are based on tried
and tested technology and are the most open of all the networking software
I've tried.

The main problem with MiNT-Net (and NFS) is that they are both in early
stages of development and AFAICS don't quite yet constitute a full and
proper networking system.

I'm *extreamly* hopeful though that they will turn out to be the best
solution in the long run.

:-)

812. A Falcon Developer Speaks about Doom...

Newsgroup: comp.sys.atari.st
Date: 1994-04-15 21:53:17 UTC
From: wilsont@rahul.net
Message-ID: <CoBM4t.38x@rahul.net>
Source record: 189267

Yes, I'm a real falcon developer, I wrote Sonovisa which is currently
selling, I specialize in graphics, and have written texturemapping
routines, and know how to use the DSP.
(Theres my credentials if you care...)

A few Things to note:

1. The blitter in the falcon is slow, A tower of movem.l's is faster.

2. The 256 color mode in the falcon is *worthless* for texture mapping.
It takes 8 word writes to change one pixel to any value.

3. True color is a lot better, since you get 1 word/pixel. However, its
that WORD write over the standard VGA *byte* required that slows it down.

4. the DSP isn't much help either. Why? well it only has 32k of ram
total to use, And transfering textures is done over the same slow bus.
The DSP could do 3D transforms, but its not gonna help texture mapping.

5. Wheres the money in it? Hey, I like the falcon and atari, but I can't
see the point in porting stuff to the falcon. In the case of Sonovista
The Falcon was suited perfectly to the application. And we sell
Falcon and software bundled together.

In the end, a person could port Doom over with everything, sound,
graphics and such, but it would be too slow. So slow that it would
be unplayable. As and example, a 386-16SX had 1-2 frames a second, and
maybe got to 8-10 when the screen was shrunk all the way down to
its smallest setting. (80x60?)

This has been my professional Opinion.

If you want to play Doom on an Atari, buy a Jaguar.

Message-ID: <CoBnuw.GAn@cix.compulink.co.uk>
Source record: 189264
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

>I have been told the way to go is Mag!cs or what ever its called..
It is [g], I have been using it now for few months and I find that is
very stable and runs most Atari software.
There are some problems with PD stuff which is not well written.

It works with the Auto Overscan and by now I have given up on software
that is not screen resolution independent, such as Protext, if I
wanted a PC I would have bought one. :-))

>How does this stack up with Geneva, compatiblity with older software,
>how much ram used etc...

It uses around 350K ram, I don't know how much Geniva uses with the
Shell included, no good quoting usage without a shell.

>What sort of support will I get here in New Zealand, and what will it cost me..
Well System Solutions is the UK distributor for Mag!x and the software
is properly supported.
The cost for upgrades will be a nominal fee of around £15 for minor
updates.
The present version of Mag!x works with Sts, STes, TTs but not
Falcons, the Falcon version is to be release sortly.

>Can I buy it by Credit Card, etc..??
Yes we do take CC.

>
>The other things are what type of DeskTop shell will I need, Please don't say
>Gemini, I am fed up with half baked Translation of German programs, plus
>I have never liked Gemini...

Mag!x has its on shell call Mag!x Desk, it is very good, has some
realy nice touches, such as unlimited number of Icons on desktop and
installed programs, additional program icons, additional file icons,
etc.

>I still use Neodesk, will it work 100% with it and support all its features..??
I don't really know, never like Neodesk and haven't tried, but it
should work.
We will be also selling a replacement desktop from Germany [g] called
Ease, this is very good, more flexible than the Mag!x desktop.

>No I don't wish to spash out hard earnt money just to fing I have been conned
>like I have with Auto Overscan, with no support..
No much to support with the Overscan, the software updates can be
obtain from us or from Compo.

>There is very little support for most German programs out side Germany,
>so who will support Mag!cs...???
We will. [g]

>With Neodesk and Geneva I get full support on GEnie, were would the update
>support come for Mag!cs..??
We are on Cix so you can always get through to me with any querries.

>A BBS may be, like GRSRZ has or even GEnie, or even a good FTP site, that
>works like GSZRZ does.....??
SS have a BBS running 24hrs and 14400, the number is; 081-299 3933

>All food for thought...???
Uhmm!

>Can any one answer these questions..??
I've tried. :-))

818. Atari Falcon Serial I/O

Newsgroup: comp.sys.atari.st
Date: 1994-04-16 01:19:01 UTC
From: <>
Message-ID: <2onee5$etq@mother.usf.edu>
Source record: 189236

I put these messages on GEnie, and I was wondering if anyone here could help.

I have been dinging around with the SCC for a while now with marginal success. I have a sequence of numbers that is sent to the SCC to initialize it, so I have been using that. In order to get baud rates higher than 19200, you have to set the chip to x1 mode, rather than the normal x16 clock mode. Well, in the process of figuring out the normal x16 rates, I discovered, that the values that the Falcon's BIOS gives to the chip are consistent with the PCLK signal being 8.0544mhz, NOT 8.0000mhz like we're told. This caused confusion, but in my tests, I would only have to try either to see what worked.

The next thing I did was to reset the chip with one change to the values being programmed into it. I set the chip to the x1 mode, instead of the x16 mode. I soon discovered that, using the formula for calculating the baudrate countdown values, the 8.whatever mhz signal does not allow me to hit any of the standard baud rates dead on. So when I set the closest value and tried to use the modem, it was apparent that the data rate was very wrong. Some times, I would get a rate that the modem would 'sort of' recognize, but when information came back from the modem at full tilt (I asked it 'at&v'), most of it came in garbled. Calculations also showed that the baudrates I was setting the chip to were only a few percent off, which is perfectly acceptable for async, and even 19200 and 9600 when the chip is in x16 mode are slightly off. This tells me that either x1 mode doesn't work, or that the PCLK rate that Atari says is being given to the chip is REALLY different.

Next, I'll be trying to use the RTxC signal being piped into the BR generator and see how that works. I want to avoid the TRxC signal since it can only be divided by 1, 16, 32, and 64. Ick.

Later......

OK... Just a minute a go, I made a few minor changes to my testing program. Instead of the PCLK, I connected the 3.672mhz RTxC clock in x16 mode to the baudrate generator. I was able to get baud rates with decent accuracy at up to 57600.

But then I put the chip in x1 mode and bye bye it went again.

The formula for calculating the timeconstant for baud rate is:

$$\frac{\text{clock frequency}}{(\text{bit rate}) * (\text{clock factor})} - 2$$

When I use the clock factor of 16, this works fine. When I use the clock factor of 1, it does not.

Given the data that's coming in, does anyone have any suggestions for a round-about way of determining if the baud rate is too fast or too slow? I know where I can find a device to measure the frequency coming out of the port, but taking my computer there would me most inconvenient. If I can find some that work correctly, then perhaps I can determine what's wrong with my use of that formula.

1. The 256 colour mode is not *worthless* for texture mapping, because
you can use the DSP to convert planar -> chunky pixels, which also
means that the DSP is not so useless as you might think for texture mapping.
2. You can do the conversion with the SOUND-DMA and get a respectable 25fps
texture mapping conversion 'free' and have enough DSP time free to do 8
channel sound.

:>In the end, a person could port Doom over with everything, sound,

:>If you want to play Doom on an Atari, buy a Jaguar.

I disagree totally, A Falcon could run Doom as fast as a 486sx-25 with some
careful programming, you have to remember that a substantial part of the
cpu time in doom goes into transfering graphics data to the screen, on a
Falcon this is 2 times faster than most PCs.

Some people have been having problems locating the pl10 test version. Well its on atari.archive now (but you may have more luck accessing it as msdos.archive.umich.edu). I've also just sent it to ftp.uni-muenster.de (though it may take a while to get moved to a public area).
Steve.
P.S. In case anyone missed my earlier post, the pl10 test version may fix the Falcon crashes (but don't bet on it).

I would suggest you combine the two... get a MegaSTe, if you can
find one used they are a great bargain, having an internal SCSI drive
and all the TT030/STe ports (sans the analog joystick ones). 16MHz
may not be a lot compared to a Falcon030, or one of the 25 or 36MHz
k, but it is nice.

I have two MSTe's right now, and one of them has a bad HD controller
chip in it otherwise it is perfect (I spend 250 bux renewing everything
else with it!) oh... yeah... a Mega STe has a VME slot for all those
cool graphics cards.

>be upgraded with SIMMs and apparently is a pain in the ass to upgrasde

Not so anymore... the XTRA RAM-8 allows you to add 8 more MEGS of RAM
to your ST. I know it works on a Mega, and it may on a MSTe, but I have
seen them for sale at a few Atari dealers.

>place to stick a 1 meg ram disk.
>
> Dan Ackerman
> ackerman.29@osu.edu

Use MiNT and the RAMFS XFS file system RAM Disk driver and add the following line to your MiNT.CNF file :

ALIAS B:\ U:\RAM\

This will make B:\ an alias drive for the RAM DISK. If you use an older MiNT that doesn't have mounting ability you have to use

ALIAS B:\ R:\ which is still a waste of a handle.

I use this :

ALIAS B:\ C:\DISKB\

A folder on my hard disk stores what some programs like to put on drive B: and I never have to read an alert about inserting a disk for drive B:

If you use RAMFS, the entire RAMDISK is dynamically sized.

841. Gnu C fault???

Newsgroup: comp.sys.atari.st
Date: 1994-04-16 07:13:00 UTC
From: Andreas_Steinbacher@me.maus.de
Message-ID: <199404160913.a8308@me.maus.de>
Source record: 189256

```
Hello!

I have installed Gnu C in Version 2.5.8. This Version and also 2.3.3
obviously have the same fault. The following program converts Fahrenheit in
Celsius. It's a sample out of the book "Programming C" from Ritchie,
Kernigham.

----------------------------Cut here---------------------------------

/* Programm zur Umrechnung von Temperaturwerten aus Fahrenheit nach */
/* Grad Celsius */

main ()

{
float fahr, celsius;
int lower, upper, step;

lower = 0;
upper = 300;
step = 20;

fahr = lower;

while (fahr <= upper)
{
celsius= (5.0 / 9.0) * (fahr - 32.0);
printf ("%4.0f %6.1f\n", fahr, celsius);
fahr = fahr + step;
}
}
-----------------------------------------------------------------------

The output of the program after compiling with the command

cc fahr.c -o fahr.tos

is:

0 -17.8
20 -6.7
0 -17.8
20 -6.7
0 -17.8
20 -6.7
0 -17.8
20 -6.7
etc...
```

The right result should be:

```
0 -17.8
20 -6.7
40 4.4
60 15.6
80 26.7
100 37.8
120 48.9
140 60.0
160 71.1
180 82.2
200 93.3
220 104.4
240 115.6
260 126.7
280 137.8
300 148.9
```

I got this with the following commandline:

```
cc -traditional fahr.c -o fahr.tos
```

By examining the assembler source fahr.s it seems that the Gnu C compiler has problems with the internal functions which convert int to float.

How do I solve this problem without always using the parameter -traditional?

Is there a fault in the compiler? And if yes: where do I get a correct compiler?

Bye, Andreas!

When you use ICDCDROM.BOS, you're obviously not using Atari's MetaDOS
drivers (at least not their BOS driver). Try CDARGEN.BOS... That's why
I wrote what I wrote ("For a solution for the first problem, you'll
probably have to get a third-party driver (ICD's or Hard&Soft's come to
mind)."). :-)

The last we heard from Aaron was that he was still working on v2.30 of FzDT, and that he hoped to have it done sometime in May. But, as it was supposed to be ready for release in February and then March, a certain skepticism might be in order. <g>

To be fair, however, Aaron is working full time to cover school costs, and has had some recent personal tragedies to deal with. We are still optimistic that version 2.30 will see the light of day soon, but like any good Atarian, are realistic enough to know that it will most likely be delayed further.

There are several options for telnet access in the greater Des Moines area. Drake University and Iowa State University both have full Internet access, if further education is in the picture. There is a commercial Internet provider based in Johnston (I think), which is adjacent to the north. (There is a regular c.s.a.s reader who accesses that way, if he's reading this... Hi, Lannie! Remember M.A.G.I.C.?) And, there are the online services that have Internet access. (Not mentioning any names...)

There is even an Atari User Group in the area, should you feel the urge to actually meet face-to-face with other Atarians. <g>

Hi,

I have joined the Atari world about 2 months ago, and I have been looking
for a terminal prog. that supports Zmodem. What I would really like is
a Zmodem that can auto-start transfers. I did look at Connect v2.46, and
from the doc's, it sounded great; unfortunatly, I only have a stock ST, and
the system doesn't have enough memory for Connect.

Can anyone please tell me what the best term. software is for Atari netting?

Thanks,
Matthew.

: --
There is a copy on atari.archive.umich.edu in the atari/Telecomm dir,
however, it is missing the .rsc file. (i.e. no workey). Now, I did
send mail to the programmer, Mark Matts, and he should be releasing
a complete vs. soon. I would imagine that it would be uploaded to
atari.archive. Now, there is another alternative . . . you could
dial up Mark's BBS. It is in the UK, and the number can be found if
you unpack the disfunctionate tterm2 on a.a.u.e. Look in the text files.

Hope this helps . . .

Matthew.

>a real floppy...)

Or you can buy Kobold (for DEM 130). Basicaly it does exactly that:
it analyzes the FAT and then it just slurps the files in. Similarly when
writing. Version 2.5 is very good - it works in turbo mode on Datalited drives
without any problems. (But it allows you to acces some drives in GEMDOS mode
if you have to).

New Falcon Art Package: RAINBOW v1.0

What? * 16-bit colour* 100% machine code (no slow GEM)*
paint studio photo studio* Tabby-driver* fast-palette*
rearrangable user interface switch freely between VGA/RGB during session*
*useful tools, difficult to explain but take a look at the demo version
and you will see what I mean*

Initially RAINBOW was developed as a tool for professional game programmers,
but it is also very useful and enjoyable for 'amateurs'. (low price)

Where? Demo version on German ftp-site: ftp.tu-clausthal.de
pub/atari/falcon/graphics/painter/rainbow1.zip
...and on most swedish BBSs with a falcon area (be sure to get v1.0)...

The demo version has everything but the SAVE-option.

Date: 1994-04-16 16:10:33 UTC
From: dackerma@magnus.acs.ohio-state.edu
Message-ID: <2op2lp$p74@charm.magnus.acs.ohio-state.edu>
Source record: 189279

My personal choice between NVDI and Warp9 is NVDI. It works beautifully on the F030 and with MTOS. If you use MTOS at all Warp9 is out, it doesn't work and who know's if it will ever. I've had a problem with a few games if I boot NVDI first but that's easy to avoid with any boot configuration program.

Warp 9 does have at lot of bells and whistles, but if you are a serious user as opposed to a hobbyist, you'll want NVDI.

Just my .02 worth.

867. SLIP FAQ (Software List)

Newsgroup: comp.sys.atari.st
Date: 1994-04-16 21:22:00 UTC
From: dackerma@magnus.acs.ohio-state.edu
Message-ID: <199404162121.RAA21042@bottom.magnus.acs.ohio-state.edu>
Source record: 189288
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

As a start to the Atari SLIP FAQ, I have prepared a preliminary list of software available for the Atari 680x0 series. If you know of any additions or corrections please let me know.

ATARI 680x0 TCPIP Software List -- April 16, 1994

Ka9q (old version): Available at numerous sites, although several sites have been reported to have a corrupt version. Good copy located at ftp.tu-clausthal.de under pub/atari/telecomm/tcpip. Wolfgang Ley moderates this site and has made sample configs available in the same directory.

KA9Q-Nos: SLIP, PPP & NNTP software. Currently supported. Mail reader available. Located at ftp.tu-clausthal.de under pub/atari/telecomm/tcpip/ka9q & ftp.demon.co.uk under pub/atari/ka9q (this site is maintained by the author of the atari version).

MiNT-Net : Port of Berkley Unix Sockets, still in an early stage. Looks promising. Still under development. Requires MiNT to run.\ Available at most Atari FTP sites. atari.archive.umich.edu in atari/Mint/Net

pe1chl: A version of Ka9q, available for both the Atari and MSDOS. Currently supported. Available ftp.tu-clausthal.de under pub/atari/telecomm/tcpip/pe1chl

STICP: Available at many Atari FTP sites. I dont believe that it is supported any more.

TUW-TCP: Standard package designed for Ethernet card, but sources and instructions available for making your own driver. Runs as an .ACC or .PRG. Does not like MultiTOS. Located at ftp.tu-clausthal.de under pub/atari/telecomm/tcpip/tuw-tcp.

I have a volunteer willing to translate the final FAQ to dutch, it would be nice to have volunteers for french and/or german, etc. I am also still looking for suggestion, info, tips tricks etc. If you have any thing you would like to share about these packages or SLIP in general feel free to send it.

>power out of the beast. Who'll do it? I've asked one Finnish demo-group
>- but haven't got any comments yet. They _can_, I'm pretty sure. But another
>thing is, if they will... Let's hope.

If you are the person who asked this at Necronomicon BBS, you should have your answer by now... But I'll answer this also here...

As it comes my opinion... It can be done. Raycaster alone does not take so much cpu-time, the same kind of discussion was going in alt.sys.amiga.demos, and one coder (Mats Knip, also from HUT) uploaded there some small demos he had done. They were much like doom or wolfenstain 3d, but without all textures, just plain walls. Program called 1frame.exe runs - as its name says - on every frame (50 fps) on standard 7.14 MHz Amiga 500. 2planes.exe was the same except it has depth-shading on the walls. (And didn't manage to keep the speed of 50 fps...)

Thish should prove that the only hard part is drawing the walls fast enough. On falcon the only suitable mode for this is true-color, as it is the only chunky pixel mode in the bird. Planar modes just can't be used for fast texture-mapping, so forget those ideas of reducing colors to 256. (Although doom does not do texturemapping in very strict definition... there is rotation only around y-axis...)

Fact is that it can't be done in 50 fps on falcon. (I'm talking here about PAL frequencies...) It just can't move enough graphics in one vbl. Two frames should be very well possible (25 fps in PAL), and three frames certainly (16.6 fps in PAL). Even on 3 fps is it not too slow to be playable, many 3d-vector games run in much lower refresh rates.

We (Aggression) are still not going to do it, since we have not enough time. We have other game projects, too bad that none of them is for falcon. (Although those STe-games we are doing now will of course be falcon-compatible, and maybe there will be some extra for falcon owners.) I can't answer any questions conserning our game projects, so don't e-mail me if you have something to ask about them.

What comes to the debate of using C instead of assembler in games... why not, but as it comes to my experience, the most optimized code is a result of the used system for some routine, not just calculating clock cycles and selecting the fastest option. What I mean is that if you for instance sort a table with a slow algorithm your C-compiler will not replace it with a fast one... unless you have a compiler with great amount of AI... It is not impossible to reach same speeds with C than with assembler, but when we are talking of the most

optimum speeds, the best advantage in C, its portability, will dissapear. You can't tranfer the code with machine specific optimizations... And that's exactly what is needed in here, for instance, to make the drawing to the screen as fast as possible.

Of course the game system can be ported as C source, but I suppose that it is not very optimized C code... (If the results of its speed reported here are correct, I have played it only on 486DX2/50MHz...) Just to compare it to those small demos by Mats Knip, it takes far too much time. At least the drawing is as easy on PC as it is on falcon, as VGA uses chunky pixel mode.

If you want to see what can be done on STe, take a look at Braindamage demo (available at least in a.a.u.e in STe-directory). Its endpart, a ride through a city, is very similar to doom (although no textures). It is partly pre-calculated, but runs every frame, and has more than half of raster time left. If you know how horizontal rasters are done on ST, you will notice that the rasters in lower part are "in sync" in color 0, which proves that we don't use the raster time during that for anything else.

Kiia Kallio

>non-april issue of other magazines.
>ilure.

Are we talking about SMS2 or OMEn here or both?

Either way, I think the following statement is more or less correct,
especially for OMEn:

>Personally, I think the whole idea is ludicrous and doomed to failure

No offense to the authors intended, but what market were thay addressing
when they chose to write OMEn? Who is going to write software for an OS
which isn't standard on *any* machine. The fact that it runs on other more
popular machines does not help in making programs more portable. PC and
MAC owners for a start just aren't going to be bothered.

Roland.

Source record: 189294

>I'm currently trying to hook up a NEC Intersect CD-Rom reader to my
>1040 STe tos 1.6 4 megs with a Supra SCSI host adaptor. Should this work?

Yes

I don't know anything worth knowing about MetaDOS so I won't comment,
appart from the fact that the freeware 2.3 doesn't seem to support ST host
adaptors by default and therefore is useless on the ST (AFAICT) :-(

>Are there other drivers I should know about?

There is the ICD Pro utilitly disk which have a MiNT/MTOS driver on them
which does work (although it has some limitations).

There are also another couple of drivers just appeared. One of which id
called EXTENados (or something like this). Both of these are apparently
better than the ICD one.

Chris,

All NeXT machines, starting from 68030 cubes with only optical drives and
ending with the latest 68040 Turbo Color, have the 56001 DSP built in.
The NeXTdimension has no use for the DSP, since it's sole purpose is to
have 32bit graphics display at the same speed as a monochrome NeXT, and to
have lots of other nifty real time video features (all this is where the
i860 comes into play).

Peter.

877. Re: RAM doubler for Atari?

Newsgroup: comp.sys.atari.st
Date: 1994-04-17 01:38:20 UTC
From: ekl@sdf.lonestar.org
Message-ID: <CoDr7y.Gur@sdf.lonestar.org>
Source record: 189299

```
========================
I doubt the technique could be applied to the TT/Falcon machines (it needs 030
or better), give the way GEM works. Personally, I'm of the opinion that if you
need more storage or RAM capacity you should shell out for some more HW...
You're bound to get problems someday.
========================

It works because the MAC uses software memory management, it then combines the
software and the hardware memory management to make maximum use of free
RAM. However, it sounds like it simply uses memory that is not in use.
GEMDOS and MiNT are highly into dynamic memory where you don't take all the
RAM you might need, but you only allocate what you are using anyway, so
we can run the two programs you mentioned in 4MB of RAm, they need the
RAM Doubler to do so.
```

Steve,
Yes, it works quite well. I have one set up here. It's connected through
and ICD SCSI+ and I use software from Beckemeyer Development to do all
my backups and restores. BTW, DO NOT terminate the tape drive if you use
the ICD SCSI+. It causes bad things to happen.

While someone pointed out JPEG Viewer v2.xx as a 'slideshow'
program for JPEG & GIF images, it's not quite what I was
looking for. So if anyone knows of a GIF/JPEG slideshow
program (shareware/freeware/PD) for the Falcon (one that'll
automatically cycle through pictures and, preferably, scale
down high resolution pictures to current resolution -- and
not just by 'halfing' them), PLEASE let me know.

Also, if anyone knows of a Falcon .MOD player capable of
handling .669 format files, PLEASE let me know.

Thanks!

887. Copying - Salvage Files - PD w/out FTP

Newsgroup: comp.sys.atari.st
Date: 1994-04-17 08:44:57 UTC
From: mcwilliams@wmich.edu
Message-ID: <1994Apr17.034457.17343@wmichgw>
Source record: 189062

Need some help!

I first and foremost need to find a way to get PD software to my Atari which has no modem. I can retrieve everything I need at work on an IBM that has no sector editor. I'm not sure what other way I can download things to the PC and then read them directly into my Atari.
REAL PROBLEM #1) I have MasterTracks Pro for my Atari and I have been using it for years to record music. Unfortunately, I never did send in to get my backup copy and Passport has since quit manufacturing and supporting the people who bought it. I've begged many times for them to search their desks for one copy that they could send to me but it was too much effort!! JERKS!! The disk is copy protected. How can I make a backup of this!!
REAL PROBLEM #2) I have sequence that I only made one copy of about two years ago. Apparantly the file has gone bad. Is there a utility that can salvage bad files? Am I doomed to spend another 160 hours on this song?

I realize I am stupid for not taking precautions then. I know so much more now and much wiser and less stupid. But if anyone can help, I would greatly appreciate it! If I can't FTP, is there someone I can get a bunch of PD software/utilities from? I have a calculator accessory I can trade...I'm so pathetic!!! HELP ME!!!

What type of 'problems'?

> So anyways, in any makefile, I always add the -mint switch to the
> CFLAGS line. Works fine for me.

Assuming you are only using the MiNT-Library, it would be a good idea to
rename the MiNT-Libraries to their GNU equivalents. I wrote a small script
I always use after unpacking the new libraries. So you never have to add
-mint to CFLAGS.

```
#!/bin/sh
mv bmcrt0.o bcrt0.o
mv bmgcrt0.o bgcrt0.o
mv bmiio.olb biio.olb
mv bmiio16.olb biio16.olb
mv bmint.olb bgnu.olb
mv bmint16.olb bgnu16.olb

>
>Thanks,
> Matthew.

Well that leaves only THE STORM and RUFUS 141, the Big problem with Rufus is its still in German and has no Medium Res support, its a great Terminal program, but it has this lack of English support, a great pitty..

THE STORM has the features you need but is still a bit Buggy, its upto version 1.02, but you will need all the 4 parts to update it to that version, it does Background dialing and Background Zmodem dnloads as a Program, its the only one I know that does this....

There is also this funny thing called Stalker 3, not PD, but it does not have built in text Editor, you have to get STneo as well, does background Zmodem dnloads as a ACC...

I think this is for a major update....

I will leave the rest for the other netters to answer...

You don't need CTS fixes for Dnloading, but you do need biger buffers.

Use HSMODA02 its claimed tp be the best.....

Will fix uploads and dnloads....

Also are you trying to save to floppy, I don't know if that is possible
with hs tranfers, but if you can set the dnload buffers large...

This is posible with GSZRZ a German Zmodem program....

This has no support for VT 100 and uses a poor version of Zmodem that is to
slow...

Not what I would call a good terminal program, and has not been supported
by the author for over a year...

Message-ID: <01HB9Y4BEKOI8WY2MF@SNYONEVA.CC.ONEONTA.EDU>
Source record: 189070

Brian:

The ST/TT/Falcon can read standard 720kb PC disks with no problems, so if you can FTP thru work you should have no problem. I used my roommates' PC to FTP lots of software before getting a modem.

BTW, what ST do you have and which version of TOS does it have? This is important since older versions of TOS can't properly format PC readable disks...

REAL PROBLEM #1:

SO, your music program is copy protected, huh? Some of these programs are easily copied using standard copy programs like ACOPY, ProCopy, etc.

However, many of these programs are unavailable and difficult to find. For starters you can try FTPing a program called DiskMech. This is a good disk analysis tool that also can do copies of protected software. As it is shareware, getting it would be inexpensive and not cost you alot of money.

If it can't copy your disk it can be used to at least do a complete disk analysis which then can be posted where someone might be able to suggest a commercial program to fit your needs. However, as your music program is kind of old, there will probably be several copy utilities that will able to handle it.

Also, there are still several mail-order PD vendors in the states that offer a good variety of stuff. Send me E-mail directly if you want some address and related info regarding these companies.

I hope this at least points you in the right direction....

Ari

Is there anybody out there who has sufficient experience in C-programming
in order to compile the C-program Astrolog 4.10 of Walter "Cruiser" Pullen
for the Atari ST ?

The sources are available via ftp in hilbert.maths.utas.edu.au in the
subdir pub/astrology/Astrolog named ast41src.zip.
I also can send them via email (270 KB, uuencoded even larger)

Astrolog 4.10 is a freeware program which can do basic astrological compu-
tations and which surely would be welcomed by many ST-Users. I also know
of some which are looking for such a kind of program.

Is there anybody who has enoug interest and knowledge of either astrology
and c-programming on the ST in order to do such a work ?

>
I do not know of any FTP sites that have ANSITerm, but if you know of one what does not have it, I can put it there. It would be best if I put it on an FTP site rather than mail it to you so that more people can get it.

ANSITerm 1.91 is the version of ANSITerm you get when you register it, and there are a few nice improvements that I don't even remember since it's been so long since I implemented them. They include things like faster scrolling, linkable macros, and auto-logon.

There is no ANSITerm 2.0. IF there is ever a new version of ANSITerm, it will be called ANSI Link and it will be Falcon/MultiTOS compatible and run in a window. This is a long time off since I have a too many other things to do, not to mention the magazine.

Also, ANSITerm works on the Falcon too. That's what I'm using now, in fact. The problem is that it doesn't do baud rates higher than 19200, it can't hangup, read DTR, or sent a break signal. In that regard, it broke just like most other pre-Falcon terminal programs. The rest of it works just fine.

From what I have seen, all the bench marks point to NVDI for 256 colours and over-below that, most benchmarks/magazine comparisons seem to indicate that there is way less difference between W9 and NVDI as far as speed goes. It really depends on your use. I am a prime example. I now use Warp 9 on a 4 meg 1040 STE with mono monitor. However when I get my Falcon this spring, I want a SVGA monitor. So I will be springing for NVDI for the colours! :-)

912. Atari United! Conference on Free-Net TONIGHT (Sunday)

Newsgroup: comp.sys.atari.st
Date: 1994-04-17 18:07:43 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <2orttg$k2i@usenet.INS.CWRU.Edu>
Source record: 189087
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy,rec.games.video.atari,alt.games.lynx

On Sunday, April 14, 1994 at 8pm Eastern Daylight Savings Time, the
Cleveland Free-net will be sponsoring a live Atari Conference on Free-net's
local chat system (the IRC). This sunday our special guest will be
Patti Barbierno. Patti is the co-founder and public relations person
for Atari United!, a national Atari Users Group.

All Atari users are welcome and encouraged to attend this meeting.

The meeting's format:

>From 8pm until 9pm the meeting will be a semi-closed forum consiting
of a question and answer session with Patti. Only myself, Patti, and
any auxiliary operators will be able to send text on the channel...

However, users will be able to ask questions by sending a private
message to myself...I will then forward the questions to Patti at the
appropriate time.

Send any questions to me at aa338@po.cwru.edu.

I will have details on using the chat system and our conference in
the general bulletin board of the Atari SIG ASAP.

To get to the general board type 'Go Atari' at the "Your choice ==>"
prompt. Next enter '4' to get to the general bulletin board.
Finally, look for the post towards the bottom of the list called
'IRC Crash Course'. You may need to hit '+' a few times inorder to page
down the list of bulletins.

In the meantime, the conference will be held on channel #Atari

Once again the date for this event is Sunday April 17, 1994 (that's
this next sunday)...

Time: 8pm EDT

At least during the formal part (the Q&A with Patti)
I'm going to have the channel set up so only operators (our guests, myself,
and an auxiliary operator) able to chat on the channel...

You will be able to ask questions, however...they will submit their
questions to me by typing

/msg ATARI_SIG ask (their question)

This question is placed on a queue...

What's more, users can view these questions (view the queue) by sending me this command

/msg ATARI_SIG View

This not only let's them know how long "the line is", but it helps prevent people from asking the same question...

: which has no modem. I can retrieve everything I need at work on an IBM that
: has no sector editor. I'm not sure what other way I can download things to
: the PC and then read them directly into my Atari.

Download to that PC. On the PC, format a 3/5" disk to 720K and use it to
move the stuff to the ST. (You can format the disks on the ST instead,
provided you *first* verify that it will produce disks usable on the PC.
The format routine built into early versions of TOS missed one critical
2-byte field; I think that was fixed around 1.62. A number of third-party
format routines claim to produce PC-compatible disks, and a few of them
actually do. Note that aside from the failure of early TOS to correctly
set this 2-byte field, there is *no* difference between TOS format and
MS-DOS 720K format.)

It was none other than Tommi Hietavuo that wrote on 10 Apr 94 that ,
TH> prove that we're serious. If anything.. But there'll have to be
TH> _lots_ of us
TH> doing this! Everybody is needed now. In England, people succeeded
TH> to get Civilization for ST by doing this. If this works, we could
TH> try the same again

Well I'm not for putting a downer on the effort's but I think the 'letter'
campaign was only partially responsible , the main reason MPS converted amongst
other's Civilisation was because of the phenomenally good sales of
F1 grand Prix.

TH> - e.g towards MicroProse (who promised Falcon-games, but...).

No ,Microprose never promised Falcon games .. merely that they would ensure all
there games were Falcon compatible. Problem ATM with MPS is
that they have severe financial problem's and were rescued only by the
intervention of Spectrum Holobyte who haven't considered Atari for a long time
.

TH> Let's start - and see what'll happen! There's nothing to lose..

Agree with that though !

> We (Aggression) are still not going to do it, since we have not enough time.
> those STe-games we are doing now will of course be falcon-compatible, and maybe
> there will be some extra for falcon owners.)

I understand well that you don't have much time to spare for unscheduled projects. What, however, makes me wonder a little, is this: considering that Falcon _is_ (whether all of us like it, or not) a computer of future. STE is past. It may be more profitable to support an older machine than the Falcon - but it is really sad seeing talented programmers abandon the Bird just, because it hasn't got enough air under its wings yet. What I mean is: if we Atarians just stick to "old" hardware, not really willing to take any risks - how long will there be Atari computers..?

And who really cares..?

I do. And most of my friends do. We believe in Falcon, and hope that the same people who make smaller and bigger wonders happen on ST/STE (demos, etc.) would use their talent and skills to produce some really great Falcon-software. Since the "big guns" (big software houses) don't have enough courage to invest on the marginal-machines (Acorn, Atari, even Mac) - very much rests on individual Atari (etc..) -programmers.

Sometimes it seems like for some people it's almost fashionable to ignore Falcon (and probably other future's Atari-models too..) - and say: "Hey, why buy such computer? It's crap anyway, too expensive, nobody else buys them - and nobody probably will..". Well, it's a very fine computer - and well worth buying. If you liked your ST - you're going to love Falcon...
Yes, it's not cheap - but it's worth its price.
And, finally: it's not a dying computer. Quite recently it has finally begun selling well. In my friendhood, for example, it's the most common Atari. And around here we have lots of Ataris..! ;-)

So: Aggression, and other demo/game-groups: don't think making "Doom for Falcon" and such things are pure waste of time and money! No way.. Because there are _many_ of us, who are going to stay in Atari-computing - and also use

the newest hardware available. So, there are - and, especially, will be - lots of buyers for your products. It's great if you support the STE-line - but don't think that today's ST/STE-owners will be ST/STE-owners forever. Nor will most of us be tomorrow's PC/whatever-users either..! Not, if there are good Atari-alternatives around. Fortunately, there are.

> If you want to see what can be done on STe, take a look at Braindamage demo

> If you know how horizontal rasters are done on ST, you will notice that the
> rasters in lower part are "in sync" in color 0, which proves that we don't
> use the raster time during that for anything else.

I've seen what can be made on STE - and it is fine, even great. But what I'd really love to see, is what can be done on Falcon! ;-)> Would you make only 286-demos, if there were better PC's available - and becoming more common..? I've used all ST-models from 520ST (w. RAM-TOS 1.0..!) and 1-sided disk drive, to very well equipped TT's and, finally, Falcon. I must say, it would be really sad for such a great computer, not to be supported. So, I (and many of us) hope that you'll find time and interest to make some mind-blowing games, and demos for the Bird in the future..!

Thanks for your interesting comments, and keep on making good stuff...

Never ever use PFX on ACC's! I thought there ws a note in the docs (not being sure if English docs are available)

AFX works fine for all kinds of data which is read completely when used e. g. fonts or uncompressed pictures.

933. The best & worst ST games...

Newsgroup: comp.sys.atari.st
Date: 1994-04-17 23:03:29 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HBAIB2929E8WYBSB@SNYONEVA.CC.ONEONTA.EDU>
Source record: 188808

Instead of the SOS, why don't we start a new thread on the best and worst games released for the 16/32 bit Atari machines?

There have been many great ones as well as some real stinkers. Furthermore, I think people could actually benefit as it could inspire them to pick up a copy (and help developers too).

All kinds of games should be mentioned. It would help if you list the genre, availability, hardware requirements, notable features, playability, graphics, and sound.

For starters, I think the following are among the best ST games I've played and seen:

* Time Bandits - Arcade. Any color ST with 512kb ram. Excellent graphics and playability. Long shelf life! Commercial (1985) and can still be found at some liquidators.

* Falcon - Simulation. Color ST or STe w/no HD and 512kb ram. Superb graphics sound and playability. Commercial (1987) by Spectrum Holobyte and can still be found at some dealers, etc.

* SunDog - RPG. Any color ST or STe w/512kb or ram. Great graphics and gameplay. Extremely long shelf life. Commercial (1985) by FTL games. Possibly can still be found at some liquidators.

* Realms - RPG/Strategy. Any color ST or STe w/512kb and no HD. Awesome graphics, animation and play. Commercial (1992) by Virgin Games. Still available at most places.

* Defender of the Crown - RPG/Strategy. Color ST only w/512kb and no HD. SHort play life but excellent graphics and animation! Commercial (1986) by Mindscape/Cinemaware. Can still be found at some dealers and liquidators.

* Star Wars - Arcade. Any color ST or STe w/512kb or ram. Just like the original arcade classic! terrific graphics and sound! Commercial (1987) by Domark. Can still be found at some dealers.

* Arkanoid II - Arcade. Any color ST or STe w/512kb. Beautiful clone of the original with very good graphics and sound. Commercial (1987) and can still be found out there.

* Andies Attack - Arcade. Any ST or STe w/512kb. Minter's classic version of Defender! Brilliant graphics in 512 colors via rasters. Commercial (1988) by Llamasoft.

* Speedball - Arcade. Any ST or STe w/512kb. BitMap Brothers classic. Awesome graphics and game play. Commercial (1987) and can still be found...

Whew...I have more but I leave listing other titles to you people out there.
But, before I go I must list some bad ST games...

Jet
Artura
3d-Breakthru
RoboCop
Missle Command
Fire & Forget
Silent Service I
Empire Strikes Back
WarHawk
Outrun
Hardball
Dan Dare

Most of these game are bad because of cheezy graphics, sound, and/or play...

Ari

Everyone's a comedian :-)

Perhaps the Atari Hardware FAQ that's posted here monthly would answer
his questions? (if I had a copy, I'd mail it)...

Oh well, quickie info from the top of my head:

68000-based system, 8mhz, 512 color palette (3 modes: 320x200x16,
640x200x4, 640x400x2), standard printer and (25pin) modem ports, DMA port,
cartridge port, 1040STfm (if an "f" then an internal floppy drive;
if an "m" then a rf modulator i.e. connect it to the TV), probably has
a double-sided/density drive (720k), a self-contained unit (keyboard built-in),
etc. I'm sure I'm missing a lot... (oh yeah, 1 meg memory built-in
usually :-)

-> which doubles the RAM. is there anything like that
-> on the atari?

Do you mean RamDoubler from Connectix ? that need's the internal MMU
of the 030 and above so would possibly work on the Falcon/TT but I doubt
very much is they are considering that market at the moment ;-(

>Rob. (roba@nutmeg.ntu.edu.au)

Rob, why don't you compile it on your ST? I don't understand this cross-compiling theory unless a completely new and underdeveloped machine is involved... the ST has gcc out for it along with almost all the standard unix utilites, tcsh, etc... what's the point of using another machine ?? if you're concerned with speed of compilation, yes, a sun box will compile MiNT 10 to 20 to 30 times faster, but then you have to transfer the thing over to the ST, and unless your ST is on the network, you're going to spend some time waiting for those blocks to go by, not to mention bothering with calling the other machine, etc...

by the way, my 8mhz mega compiled mint 1.08 in maybe 10, 15 minutes...

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions:
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR] OR use the number address (IP),
NOT both!
4) "Name": anonymous [CR].

5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once. i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having to reply "y" for each file
when asked "get {filename}?".
12) close [CR] to end (go back to ftp and
13) quit [CR] to go back to UNIX or.......
14 bye [CR] to end and go back to UNIX (or 'close' if you only want to quit the FTP site you're on for the moment)

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on wh ich the programs
were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or .uu.
Use the appropriate uncompress program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...)
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin yrsa" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer.
i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

944. Easy-Boot

Newsgroup: comp.sys.atari.st
Date: 1994-04-18 04:09:44 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <2ot168$ji@golem.wcc.govt.nz>
Source record: 188819

EasyBoot turned up on a.a the other day, this is my boot-manager program (akin to X-Boot/Deskmanager/Superboot etc.). This is v1.0 and is basically terrible. Full of bugs and bits that basically don't work! :)

v1.5 does everything that X-Boot 3 does _except_ 'sets' and the GEM-like interface! It handles AUTO, CPX, ACC, ASSIGN, Desktop configs, and 3 other file types of your choosing (e.g. Boot-up sample, desktop picture, and bootup quote....). It also is now (As far as I can tell) bug-free, has a clock-based bootup timeout (selectable), and generally IMHO is a really good little program!

As soon as I get a modem, I'll stick it on a.a! :) If anyone wants to (ack) send me comments on v1.0 - go for it! :)

I have a 1040st and I believe I have old TOS because I got my computer in '88 and have not had it modified since. How can I find out which version of TOS I have? I realize I'm pathetic and don't know as much as the rest of you. I will be reading this group regularly however. All your help is greatly appreciated!

Strangely enough, the MegaSTE was always designed to accept another 4mb of memory on the VME bus (at the cost of some wait states), according to the Atari field technical manual on the machine. I believe there is a specific version of the Xtra RAM-8 for the VME slot on MegaSTEs.

Another surprise on the MegaSTE: It has hardware to assist in Genlocking, right out of the box. Apparently, the mono detect signal can be used as an input for an external sync. Does anyone know of software that takes advantage of this feature? Video titling software, perhaps?

This month's (Apr 94) Current Notes magazine reviews this program and
a similar shareware offering (the reviewer liked Stalk the Market much
better). There are also several ads which offer the program itself.
You can order a copy of the magazine from Toad computers (1-800-448-TOAD).

I'll pick a category: Best multiplayer games. All of these are two player
(or more) simultaneously doing something, not "taking turns".

IK+ : International Karate +, side view fighting game, unplayably fast in
turbo mode, killer sampled sound. Doesn't work on MegaSTEs.

Jupiter's Masterdrive : overhead view driving game, excellent play action.

Projectyle : Overhead view weird futuristic soccer style game, excellent play
action, excellent moving graphics, can play up to three players simultaneously
with 4-player adaptor. Does not work on MegaSTEs.

Blood Money : very hard, but lots of good guns and graphics.

Revenge of the Mutant Camels : Killer sampled sound, graphics, strobes, and
weirdness. One of the best, and shareware to boot.

Blasteroids : advanced Asteroids type game. Cooperation play only.

Utopos : Shareware STE only game, advanced Asteroids type game, good
graphics, combat and racing play.

Skychase : bare bones flight simulator, very very fast, awesome for two
player combat.

Better Dead Than Alien : futuristic Space Invaders type game.

Speedball II : overhead view futuristic football, one of the best ST games
period.

I'm reading this book, too. It's really great! ;)

> cc fahr.c -o fahr.tos

I assume you mean gcc instead of cc.

> cc -traditional fahr.c -o fahr.tos

I tried both versions on my Sun 3 with gcc-2.5.8 and on the FALCON with
gcc-2.5.8 and 2.3.3. Everything worked fine. Maybe your Assembler is broken?

> By examining the assembler source fahr.s it seems that the Gnu C compiler has
> problems with the internal functions which convert int to float.

Hmm, no idea.

> Is there a fault in the compiler? And if yes: where do I get a correct
> compiler?

On the FALCON I was using gcc-2.5.8 and 2.3.3, GNU Assembler 1.38 ATARI
PL4, GNU Linker ATARI PL37 and the MiNT-Libraries PL44.

Bye,
Knarf

Falcon 030 Probleme!!!!

Vor einigen Tagen habe ich festgestellt,
dass bei meinem Falcon gravierende Uebertragungs-
fehler beim Lesen von der SCSI-Platte auftreten,
wenn ich im 256-Farbmodus bzw. TC-Modus bin.
Hat jemand aehnliche Probleme?
Der Falcon ist einer der ersten Stunde, und die
SCSI-Platte ist eine Quantum LPS240.

1. Beispiel:
Wenn ich mir eine Sampledatei mit
Win-Rec von SCSI anhoehre, hoert man ca. jede
Sekunde ein knisterndes Geraeusch.
Im 16-Farbmodus ist dann wieder alles in
Ordnung.

2. Beispiel:
Ich lade dieselbe Gem-(X)Img Datei mit Gem-View
5 mal hintereinander. Jedesmal sind Fehler in der
Grafik an einer anderen Stelle.

Hat das vielleicht mit der hoeheren Busbelastung
bei den Farbaufloesungen zu tun??
Tritt dieses Problem bei neueren Falcons auch auf?

Greetings Andreas

958. JAguar-Developer

I don't think that this is the conversion you mentioned, but you can get
a very nice BomberMan-Clone from ftp.rz.tu-clausthal.de: "Dynabuster" is
for STE & Falcon (maybe also TT). It supports the STE-Joysticks, up to 5
players (later versions will also support the Centronics-Interface) and
it has very good sound...

965. BootXS 2.0

Newsgroup: comp.sys.atari.st
Date: 1994-04-18 09:34:47 UTC
From: d2cg@dtek.chalmers.se
Message-ID: <d2cg.766661687@dtek.chalmers.se>
Source record: 188839

BootXS / AutoXS is a boot package that will help you to easily select which ACC's, CPX's and boot programs that will be active after a boot.

BootXS is the configure part where you design your very own setups. It's completely Gem-based, and will run in any resolution (>=80 columns is recommended!), and works with MultiTos.

AutoXS is the auto folder part where you, at boot time, select one of your setups. It runs at any resolution, even low.

BootXS / AutoXS 2.0 is available at the following ftp-sites:

atari.archive.umich.edu
asimov.cnam.fr
ftp.uni-kl.de

: I can verify that this same thing happened to me using v2.5 on a Falcon
: w/ TOS 4.02...

At least you get these problems. I can't even get it to unarchive!!!

Downloaded it from atari.archive, and it is a self extracting file. Double clicking on it, just results exiting to the desktop!!!

Anyone else had this problem?

I noticed on a.a, it was a .gz file, so I used gzip on my unix box to uncompress
it. Could this be the cause? Should I have used the atari gzip? This shouldn't
really make any difference.

The same happened with lharc 2.99, but v3 uncompressed quite easily!!!

Any help?

Danny.

Ivo van Poorten (ipoorten@cs.vu.nl) wrote:
: And what is it's use?

First, the latest version of Minix is 1.5(.1.0?)

What is it's use? Well, it a port of an old version of UNIX, for the ST.
If you use UNIX, then you probably will like to use Minix.

Actually, it is not exactly a port, but a total rewrite of an old version of
UNIX. Source is included, so you will be able to modify it if you wish.
Documentation is good.A lot of Tools are provide, as well as K&R C compiler.

Well worth a look, if you like UNIX.

Er, I don't think that calculations would take much longer than a vbl, so
that would be a frame rate of 5 vbls = 10fps, which isn't bad really.

It is indeed 1.5 which is the last 1.5, that is 1.5.10 (to make it simple).
You can patch it, if you feel up to it to someting like 1.6.16 or even
1.6.25, but I don't know for sure.

>What is it's use? Well, it a port of an old version of UNIX, for the ST.

Well, it started as a rewrite of version 7, but it is becoming more and more
posix compliant (or compatible or whatever you call it).

976. New atari file selector

Newsgroup: comp.sys.atari.st
Date: 1994-04-18 12:49:10 UTC
From: dwhite@rd.eng.bbc.co.uk
Message-ID: <CoGGxy.H5s@bbc.co.uk>
Source record: 188902

For those of you who have read the May issue of ST Review, did you see the stuff on TOS 5 and MultiTOS? Anyway, there was a pretty picture of Atari's better file selector ... it was very pretty but it only had room for a standard length of file name! It seems that replacements will continue to flourish for UNIX style file selectors. Will Atari ever get it 100% right? In all fairness, all that stuff is still being developed (or rather, sat on!).

>calling the other machine, etc...

You've obviously never tried compiling the libraries :-)

My Falcon takes about an hour to an hour and a half to compile each of
the gnu,gnu16,bgnu,bgnu16,gnu020,gnu16020,bgnu020,bgnu16020. At this
point the benefits of a X-compiler are enormous. The alpha can do the
library in about 6 minutes. (I lock the compiler in memory for this :-)

And you can always copy onto a floppy disk and take it home with you.
After all, it's easy to set a job going in the background while you
work...

Simon.

I've never seen a C interpreter for the Atari platform.

The best PD C compilers are (in order of "bestness", which is IMHO):

GNU C - large, available for almost all platforms, you can
cross-compile on a much faster machine for your Atari, and also
is your only option for C++ on the Atari.

Heat & Serve C - based on Sozobon C 1.3, extensively hacked by Ian
Lepore; has a nasty bug in the supplied libraries
though (which only causes a crash under Gemini or
Mupfel shell)

Sozobon C 2.x - the official Sozobon C; dunno much about this

>Hi.

>Is there a Font Editor for Calamus?

>Thanx.

Cheapest is Fonty, from ST Club - about 12 UKP (really good for it's price)

Commercially, DMC's old one runs as an .acc.

Then we have Genus, Font Designer 2, Type Art (DMCs new one), Didot, Didot
Lineart, Didot Professional (now called DAs Layout).

I think the author of Genus went on and wrote another one, though I can't
remember what it was called...

Plus Avant Vector can also edit .CFNs.

There may be others, but my brain is overtaxed...

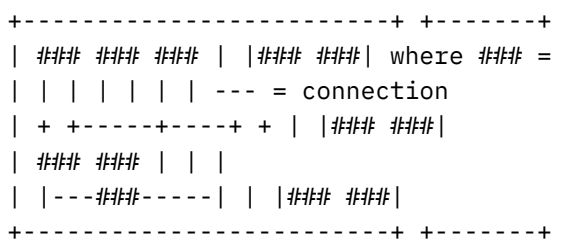
I'm trying to write a cantata lookalike for gem, using gem++ as the
toolkit. I need to have the following arrangement:



The window on the left is a workspace window, the one on the right
is a toolbox window. Each of the icons in the toolbox is generated
by scanning the disk for executable programs -> a list of options.
Each of the icons in the workspace is placed there by dragging an
icon from the toolbox, and then connected to other icons.

The resource file format is a tree for the workspace, a tree for the
toolbox, and a tree for the icons. Thing is, I need to copy icons
from the icons tree to the toolbox and workspace trees. I can't just
hide the icons in the workspace trees, since I might have multiple
instantiations of the icons in the workspace/toolbox. AFAICT objc_add
only deals with adding icons in a given tree, whereas I need to copy
icons from one tree to another, so (at last :-) is there publicly
available source code to dynamically alter the structure of a resource
once it has been loaded into memory, or will I have to make it up
myself ?

It looks pretty complex to do, although I can simplify if I need to
by only adding to the root node of the workspace, and only supporting
ICON types etc. Still, I'd prefer it if it were already done ...

Simon.

Source record: 188911

Ok, well a non-technical way to determine your particular TOS version is
to simply check the DESKTOP INFO dialog contents on your 1040's desktop.

This dialog contains copyright dates for your version of GEM and TOS. If it
says only '(c) 1985' then you probably have TOS 1.0. If it says '1985, 86, etc ' then your
proably have TOS 1.2. If you see a rainbow effect on the Atari
fuji icon then you have TOS 1.4.

Another way of going about it is (provided you don't have a clock chip or
cartridge) is to simply check the date stamp of your files from the
desktop directory windows. TOS 1.0 always stamps them with '11/20/85'.

Unless you bought your machine used or refurbished, its pretty safe to assume
that you have TOS 1.2 as you said you bought in 1988 and I understand that
Atari started putting those ROMS in all new machines around that time.

Simply check the above methods to make sure...

Hope this helps.

This is a repost. Apparently the first posting didn't make it to
the net...
I have a problem with GEMINI 1.99.
I run a MEGA ST upgraded to 4 meg, with Gemini 1.99 as an
autobooting application.
Several programs (make, cc) seem to "forget" the environment
varables when started from the console window. They cant find the
programs they are supposed to kick off (cc in the case of make, and
cc0 in the case of cc).
When i leave gemini and start a shell (msh or gulam) from the atari
desktop all works well.
I have tried to use gemenv.prg, but gemini starts to complain about
illegal env names (ENV$ROOTSIZE and ENV$OPTIONS). other env
variables defined in the root.env file are available in gemini, but
the problem with make and cc still remains.
Can anybody help me?

> Can someone explain this to me? I understand it is difficult, because you
> haven't seen my code, but knowing what this error means can help me.

Well, I haven't had a single response to this posting. But I have found
what caused the error.

The evening after I posted this article, I decided to try to solve this
strange error. I switched on my ST, and tried to compile it again (not
having changed the source) and it compiled without any problems!
Obviously the error occured because my system was confused. I have
discovered what made my system confused: before I ran my compiler, I ran
orcs (the excellent resource editor). After running orcs, my system behaves
very weird. Sometimes my editor (Tempus) crashes just because I click on
the move bar of a window. My Heat & Serve compiler becomes unreliable etc.
Resetting my ST doesnot work. I have to switch it off and on to keep my
system healthy.

Other people having the same problem with orcs?

The only problem with this is that a shareware program has to be good to get
your money. Based on the cover disk version of HiSoft C I couldn't
recommend it. Maybe its just me, but, it didn't like my style of 'C'.

I like the idea, I just didn't like the implementation, Had I been a
beginner with that program then *I* would have been in trouble. Just me,
nobody else, no Sir, no flames. Just me.

To do genlocking, you need to be able to match the screen syncs of your computer and video source so they can be mixed. On STe/MSTe machines (onwards?) you can feed in a sync via the monitor port which the video hardware on the ST will then match. Previously you needed some very nasty and expensive hacks to manage this. Why no-one ever brought out a cheap STe genlock, I don't know.

1003. 50/60 Hz Help (I think)

Newsgroup: comp.sys.atari.st
Date: 1994-04-18 16:42:48 UTC
From: mike@atlantis.com
Message-ID: <2oudapINN1dm@atlantis.com>
Source record: 188925

Hi:

I'm running a Mega STe with 4 Mb RAM. I've been trying to run a couple of programs, that I believe run at 50 Hz, while my machine runs at 60 Hz. When I run them, the screen looks as if its horizontal hold has gone bezerk.

I have read the FAQ, and tried a couple of programs from atari.archive that are supposed to correct this, but to no avail. How are these 50-60 Hz programs supposed to work? Can anyone give me explicit instructions on how to do this?

Thanks in advance,

Mike.

This is what I do. PAUSE ASAP. Jump to outside view and look around until you find him (it helps if you have labels turned on). Select the target. Selct autopilot. Hit play and blast away. This might not be a good idea if you don't have a good ship as you are now heading straight for him guns ablazing. Works for me with a Imperial Trader, 6 Shields, 4MW beam laser and auto hull repair. If it's a real nasty like another Imperial trader send a missle after him first.

You probably want two programs for this: a 50Hz booter and a 50Hz switcher.
The booter will set the sync rate to 50Hz, and warm-boot the machine (while
still preserving the sync rate, this is for self booting disks). The other
simply switches between 50 and 60 Hz. Both are available from atari.archive.

Now, use the switcher to sync your monitor at 50Hz. If the image rolls, you
need to adjust the vertical hold on your monitor. This should be a one time
adjustment (in other words, you should be able to set the vertical hold
such that it works fine for both 50 and 60 Hz). This is probably your
problem.

Note that this is the video sync rate, not the speed at which the CPU is
running. There is such a phenomena for MegaSTE's, but it is totally
independent from the video sync. For CPU speed switching, see the
Ste/Mega directory on atari.archive.umich.edu.

The video sync is the speed at which the monitor image is refreshed. The
50Hz rate leaves more of the CPU for other processing, at the expense of
slower refresh (which can cause a slight flickering, usually unnoticable
unless you stare at the monitor for a quite some time). Many games have a
50/60Hz switcher built in (one of the function keys, usually). Also, many
games will automatically switch the monitor to the correct sync rate upon
bootup. The 50Hz booter/switcher is only needed for software that does
not check the sync rate (and was written for the non-US market, for which
the default sync is 50Hz). I have several demos which require such a
program, but no commercial software.

Games run faster in 50Hz mode than in 60Hz mode, generally.

Here's my problem (and hopefully some netter can help...)

Running in ST-Medium on my Falcon and trying to get the VT-52 emulator
to work properly...currently my dilemma is changing the text color and
background color. I have been doing it on my mega for quite a while,
my question is...is the problem in the color palette mapping on the falcon
or a bug in the VT-52 Emulator? Any responses/solutions would be greatly
appreciated...

Currently CHR$(27)+"b"+CHR$(color)

Thanx in advance

|> Any comments? Maybe Dave's listening again? (Welcome back BTW,
|> news about Spectre has been missed by a lot of people).

I found this problem when the AdSpeed-ST first came out. There is a small (no pun intended) bug in the routine that determines your memory size, when the cache is enabled. But this problem only arises only on systems that have 1 meg or 2.5 meg of memory.

The solution for the AsSpeed-ST is to setup such that Spectre runs in 8mHz no cache mode. Then, after Spectre is displaying it's setup screen, use the hot key sequence to switch to 16mHz and cache.

GM>How do you solve demo level 2? I solved it twice, but by accident (I
GM>couldn't repeat the process afterwards) - and never with more than one
GM>soldier alive at the end.

If you know how to do it, it's very easy. You must go first to the upper left where are the enemy barraks. If you wait for too long there are to much enemy soldiers (they come out of the barraks). Try to shoot a rocket at the petrol barrels. When you hit them there will be a great firework. ;-) The second barrak can be destroyed with a normal grenade. When you finished this place, go to to the upper right an kill the last five soldiers with a grenade, you can hide your men behind the bushes.

GM>Demo level 4 is a bitch too - especialy since you can get killed
GM>before you even start to move...

Oh yes, this is an intermediate level. First your must run a bit up and right. Then destroy three barreks (the right ones) with three grenades. Go to the bridge, but watch out, this way is a bit tricky! Bring your men to the left at the beginning of the bridge, then go to the middle of the bridge on the left side. Stop and go diagonal to the right side of the bridge and then go straigth on the right side down the bridge. Now go down the right side of the hangar and stop a bit before it ends. Throw a grenade at the cannon. And now you should split your army into three parties (2-1-1). Whem I remember right, you have one grenade and one rocket per man. Get a one-man party and make the rocket clear. Go down fast and when you see the cannon aim and shoot the rocket at it. It is possible to loose this man in action. If he died get the next one man-party. Go down and move left through the fence (the explosion should have destroyed it). Then you see an enemy with an grenade thrower, wait till he destroyed the next fence then go and shoot him with the gun. Now go a bit to the left and throw a grenade at the barrak. Make clear a rocket and move further left and a bit up when you see the cannon upper left aim and shoot it. Now go bak to the destroyed barrek and make the next rocket clear. Go up and shoot the next and last cannon with a rocket. Between the mexican huts you find some new rockets, get them and destroy the mexican hut which is closed with a door. Now go to the upper left and destroy with two rockets the last two barraks on the other side of the canyon. But be caraful, don't shoot a rocket at the fence, you could destroy yourself. When you made this go right and shoot the last enemy soldiers with the gun. You can shoot them from the mexican side of the canyon.

Have fun!

Tschau,

/Martin/

I'll never understand why Atari didn't implement that 'right'. I guess
that a lot of third-party HD programs will do this. Right now I only
know it for sure for my own program (`SCSI-Tool').

Source record: 188943

First question (since I've been really busy the last few weeks)

Is NeoDesk 4 out or almost out? Anyone have any comments about it if it is?

I will soon be getting the new TT accelerator from CyberCube which claims to allow switching between 33/40/48 MHz. They just got the first run of boards in so I'll get one as soon as they're tested. I'll post an article once I've had time to really use it. The price is definitely right $99US ($115 CDN, not by the exchange rate - Cybercube is a Canadian company).

It oughta be neat! Has anyone gotten Spectre 3.1 yet? The last thing I saw was that it will be available really soon.

Thanks.
Sam

You bet..... this is something that could get us to buy a CD-Rom for our
Falcon`s.... :-) And if we all do get a CDrom it could maybe be the beginning
of Falcon`s take off as a REAL multimedia-machine (hope i`m not to optimistic)
it would be nice with more applications than just
musical ones ;)

>Has anybody had any experience running a Viper (archive 2150S) tape
>drive from an Atari ST(e)? Any special software required?

Runs just fine using the GEMAR shareware package. I could even dig out a setup file for it (if you're interested, that is :-)

I sold several of these, using ICD The Link or GE-Soft TOPLINK adaptors. The streamer also runs fine on "true" SCSI with Falcon or TT.

It's quite fast, too. Backup is about 4 MB/s.

You definitely will have to use at least TOS 1.04. Older versions will 100% surely run into the 40-folder-bug while doing the backup.

bye, Peter

"They will be able to run" some software which is effectively vaporware at this time. "Workplace OS" does not currently exist in release form. Nor does Windows NT. Nor does Taligent (the only vaporware OS that you didn't mention).

AIX, being a version of UNIX that already runs on RS-6000 machines (including one a few feet below me), actually does exist.

It's really quite unfortunate that there's all this "wonderful" PPC hardware, and virtually NOTHING to run on it. Very bad for marketing.

Would you buy an IBM PowerPC today, if it was offered to you? I wouldn't. Not that that would be a long-term decision; if the OS situation gets quickly in hand, it looks like a good platform that will hopefully take some of the shine off of Intel. (And once the sharks see Intel bleeding a little, perhaps they'll take a look at the folks in Redmond, too...)

Cool stuff.... I did not know this. Now with a blank VME card, I could
add RAM! It makes sense tho, VME by its very name, and with graphics
cards needing to be written to like RAM.... I need to check into this.

Thanks!

I just noticed in the new Current Notes: D&P computers has the Xtra RAM-8
for MegaSTEs for $119 (I presume it takes SIMMs). I would assume that
this is a VME card as described above. D&P's number is 1-800-535-4290.

> A Falcon developer last week stated that it can't be done, also the DSP does
> not have enough Ram for one thing....

So did MicroProse's programmers claim that the Civilization (great game, by the way..) _can't_ be done on ST..! Well - after hundreds of letters, they finally decided that it _can_ be done... Good for us, that. Got the point..? ;-)

> The Blitter is to slow, can some ome Please explain why did Atari bring out
> such a stupid machine....??

Stupid..? Sorry, but _that_ was stupid, if anything. It's kind of funny: people who don't own Falcons themselves, tend to consider the bird as a total disaster. But even more strange: I've yet to meet a Falcon-owner who _isn't_ very satisfied with the machine..! Oh, well - there must be ones (disappointed) too, somewhere. But, really, Falcon is far from "stupid" as a whole. It's one hell of a computer - and if someone really thinks that it's "slow, badly designed, rare and stupid", then the original ST was a catastrophe.. ;-) ! So much better is the Falcon, believe it or not.

So, people: instead of complaining how miserable a beast F-030 is, go and get yourselves one. Rumours and bad publicity are one thing - and reality another. Atari has made a nice bird this time. Not perfect, but... Good enough. Ornithology is fun!

>
> by the way, my 8mhz mega compiled mint 1.08 in maybe 10, 15 minutes...

Strange, it takes mine at least 20-30 minutes.

I cross-compile due to speed (#1) and memory (#2). My ST is SLOW, just
like yours... it takes me 8-12 HOURS to compile NetHack on my ST, but
only 30-40 minutes on the UNIX system at work. These days, my ST
can't compile NetHack, especially with MiNT loaded and a disk cache on
my hard drive; 4M just isn't enough for compiling large C files.

The ST isn't at all suitable for compiling C++ code; it takes a few
minutes to compile "hello world" in C++. Anything that's large or needs
optimising or has multiple inheritance chews through the 4M in my ST in
seconds. For C++, the "4M limit" is as bad as the 640k limit in DOS.

A distant #3 reason is disk speed; file access is MUCH MUCH faster on
any UNIX system than it is on my ST, even when using the minixfs under
MiNT, thanks mostly to the superior buffering.

A not-so-distant #4 would be long, case-sensitive filenames; minixfs
does this too, but some of my tools still don't (like the GNU zip I've
got, and gcc doesn't seem to act properly either). I'd much rather have
SuperWonderClass.cc instead of SPRWNDC.CC...

I really doubt "our" bad attitude has much to do with it; the developers
at id can't stand the Falcon (the post I saw said they were suffering
with it until they could port the Jaguar developer's tools to NEXTSTEP),
and there's almost no way they could pay for development of the Falcon
version (which would have to be almost completely re-done to take
advantage of the DSP and to use the 16-bit colour mode instead of the
interleaved 256-colour mode)... unless, of course, all 20k of the
Falcon owners bought a copy.

Did you use the "-l" parameter with patch (I think this has something to
do with spaces or tabs or something - the "-l" tells patch to ignore the
difference I think). Corrections to this are always welcome (and no
doubt barreling down as I type ;-)

I used Sozobon compiler to set up p2c. I use the GNUC-compiled p2c.ttp,
but I recompiled the libp2c.olb using sozobon. Worked perfectly, and
much faster than GCC. p2c generates plain old impossible-to-hand-code
K&R C, so sozobon is sufficient.

To all wannabe Pascal users out there:

I used Sozobon compiler to set up p2c. I used the GNUC-compiled p2c.ttp,
but recompiled the libp2c.olb using sozobon. Worked perfectly*, and
much faster than GCC. p2c generates plain old impossible-to-hand-code
K&R C, so sozobon is sufficient.

Also, I vastly cut down the p2crc file (removed all comments and all
the blank variables).

This makes a very tidy, quite fast Pascal compiler.

If anyone wants it, I can upload it.

(no, I'm not a Pascal user - this was for my SO's university course, for which
she user my old ST)

1040. HELP! FTP,IBM to ATARI transfer

Newsgroup: comp.sys.atari.st
Date: 1994-04-19 01:19:36 UTC
From: mcwilliams@wmich.edu
Message-ID: <1994Apr18.201936.17440@wmichgw>
Source record: 188963

Atari geniuses!

In my quest to download files from the Atari@Atari.archive, I've
run into problems. Nothing I've FTP'ed and saved on an IBM computer and
taken home has worked yet. I can't use ARC.TTP on anything. I may
be using Kermit wrong when I'm sending the files to the IBM (I'm actually
using the IBM to log onto a VAX account via Kermit, then from the VAX account
I FTP to Atari.archive and GET the files I want. Then once I'm back in my
VAX account, I send the file through Kermit. I bounce back to the IBM and
RECEIVE the file, possibly catching the file in the middle of its send.)
Follow all that???
Anyways, how exactly do I format the IBM disk? Size, with/without
a serial number, with/without space for system files. In short, what is
the EXACT command I use to format the IBM disk. From my understanding, I
do not need to have TOS 1.4 to stick this disk into my Atari and read it,
is that correct? What ARC program should I use to deARC my programs?
will ARC.TTP work just fine? Also, do i need to use any special commands
other than GET when I FTP to Atari.archive?
Lastly, can someone give me specific instructions to deARC a program
once I have the disk on my Atari?

Another giant Thank you to everyone that's helped me so far!!!

Chris Latham, the author of UIS, did indeed leave Applications and
Design Software and started up his own company, Power Point Software.
The major product he offered was PowerNet. When he started his
company, he advertised that he was the author of Universal Item
Selector and Universal Network and would no longer be supporting those
products. He also advertised a product called FleXor which said it
was the ultimate replacement file selector. I don't think that FleXor
ever came out and I don't think he markets PowerNet anymore. I think
it may be marketed through Dragonware but I'm not sure.

As for UIS, I don't know if anyone at Applications and Design Software
has picked up support of it.

You must not realize you are talking to the author of ANSITERM (Timothy Miller). Tim wouldn't exactly call it an insult nor shamefull, however it is true that it doesn't take advantage of some of the Falcon's capabilities...but then again it was designed long before the Falcon was public and when ST's couldn't do 16 color ANSI. I wouldn't call it a hack either as it is still the highest quality implementation of ANSI available still.

Maybe they don't own Falcons because, like me, they didn't really need
better graphics and a DSP to run their old ST stuff and when they went
to test out a Falcon, like I did, they didn't see a big enough
increase in speed to warrant a new purchase.

Sure, if my Mega STE broke I'd replace it with a Falcon and probably
be satisfied with it. Given the applications that I run, the stupid
thing for me to do would be to sell my MSTE today and buy a Falcon
tomorrow.

Shameful, indeed. Do you realize you're insulting the developer of this
shameful piece of software? While I realize it's not exactly the greatest
thing in the world for the Falcon, it's not exactly BAD either. Sure, it's an
ST low hack... I've admitted that from the beginning, but I have yet to find
any other terminal program, hack or not, that can SCROLL at a speed that I
find acceptable. On a stock ST, it can scroll fast enough to keep up with
19200. On a Falcon, Neither STorm nor CoNnect, can scroll at a speed that I
find acceptable.

>
>Is there not Terminal software that gives 16 colours and ANSI
>on a Falcon with out the Low Res hack of ANSITERM....
>

There are others that attempt to do VT100 as well as ANSITerm, but most are
usually missing SOMETHING. And the ones that do color usually screw that up.

>
>I thought Connect would do all this....
>

CoNnect is a fine terminal program. It supports multiple windows, a shell
program, high speed baudrates on the Falcon, TT, and MegaSTe, etc, etc, etc.
But then there's that scrolling speed. I do believe CoNnect does implement a
jump scroll, but unless you're in a mono display mode, it still can't keep up.
Until you've tried to write a terminal program that puts the terminal in a
window, you won't understand what's involved, and you won't understand that
THE bottleneck in performance is scrolling, and unless you can get that up to
speed, the whole rest of the program suffers massively.

Have you ever used a Mac Quadra? Were you ever disapointed at the speed text
was displayed and dialogs drawn, etc., yet SCROLLING in a window was REALLY

fast?

You know how on your Falcon, the speed of drawing text, menus, and dialogs is really fast, but scrolling is REALLY slow?

I don't really like Macs, but this is one area where they sacrificed speed in one area to really optimize something crutial. They did not put forth the effort to make drawing fast, but blitting, something of PARAMOUNT importance, they made very fast.

The problem with Ataris is that the blitter is no faster at copying memory than the 68030, or at least not significantly so. This has to be the case because the video memory resides in main RAM, and therefore anything accessing it must not hog the bus, lest it interfere with very important interrupts. There is a HOG mode for the blitter, but it takes so much time from the bus that serial I/O would be fowled up every time something used the blitter, not to mention VBI's, the keyboard interrupt, MIDI, and anything else that required use of the bus or CPU time.

This slowness is one reason why you have not seen a release of ANSI Link, a 16 color ANSI terminal program that takes advantage of the Falcon's video modes, other cabapilties, and has a host of useful other features to choose from. I implemented a jump-scroll algorythm that worked flawlessly, except that the blitting time, even when the display scrolled, say, 16 lines at a time, was still a major bottleneck, not to mention quite a number of other problems associated with what I had to do for jumpscrolling. ANSI Link would have aspired to be as good as CoNnect in much later versions, but never got past the testing stage because it did not perform to my satisfaction.

ANSITerm, on the other hand, has full control over the screen and can do whatever it wants with it. As a result, I employ a simple hardware trick that drastically speeds up scrolling speeds to way beyond any of these other terminal programs even on a stock 8mhz ST, yet it doesn't do a jump-scroll... it scrolls one line at a time, which is infinitely more visually pleasing.

So, why do I still use ANSITerm, besides the fact that I wrote it? Because it scrolls fast. It may sound silly, but I like to be happy, and the others just don't make me happy.

As soon as another terminal program is sufficiently more capable than ANSITerm, and/or my needs outgrow the capabilities of this program (as happened recently to a friend of mine who used to use ANSITerm on his Falcon), I will stop using ANSITerm and begin using another.

gcc -O -o fahr.tos fahr.c -lpml

Worked for me, without -O worked, too. -lpml isn't necessary, really.
I've got gcc 2.5.8 and the latest version of the MiNT libs.

How could anyone hate games? I mean, really, use a computer just for
"work"?!? Yuck!

The desire to program games is originally what got me interested in the
damn things (ie, computers) in the first place... ;-)

I've heard several reports of Atari demoing an MPEG player on a
Falcon030 (showing off the DSP), but that one (or any other one,
for that matter) isn't available, as far as I know.

That's a documented restriction. However, this only applies to CDARGEN.BOS,
all other parts work just fine. This means that you will have to find an
other BOS driver which supports ACSI. As I said, there are several
companies shipping better BOS drivers (and better DOS drivers, for that
matter).

There was a program written quite some time ago which compressed files as you put them into the RAMDisk, but it was only a RAMDisk and didn't do anything for regular RAM. That's about as close as you're going to get to the Mac equivalent of "doubling RAM" (which is essentially the same thing -- compressing the data in RAM and uncompressing it as needed, which may not actually double RAM depending on how well the file compresses, but can achieve somewhere around that, possibly more in some cases)

AFAIK, the only way you'll be able to do it is to reformat the entire drive.
The two formats are completely different; MACs use the HFS file format; HDX
won't even recognise it as a valid partition; as far as any HD formatting
program is concerned, that portion of the hard drive remains unformatted
because it can't recognise any previous (or current) format because it doesn't
conform to the GEM or BGM format standard; it's HFS.

> BTAB approved according to British law.

Hmmmm........I don't know anything about UK law, but here in the U.S., the FCC regulations that the Falcon has to comply with (part 15) are COMPLETELY different from the regulations for interfacing to the phone line (which is part 68). Obtaining FCC certification costs $1500 and up and takes around 3 months or longer.

IDE is cheaper.

SCSI is faster and is capable of dealing with larger drives.

The latter isn't really an issue if you are *not* dealing with the BIOS
calls of an IBM PClone. (There's some unfortunate interactions there...
there are three parameters, and both the IDE spec and the BIOS put limits
on each of the three. The IDE spec limits total drive size to around
24 gig, and the BIOS spec to around 8 gig -- or do I have that backward --
but because the *lowest* limit applies to *each* of the three parameters,
the combined limit takes magic tricks to get to 1 gig.) .

1057. Easy-Boot v.15

Newsgroup: comp.sys.atari.st
Date: 1994-04-19 06:16:52 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <2ovt0k$am5@golem.wcc.govt.nz>
Source record: 188980

v1.5 That should read!

Easy-Boot v1.5 has been send to atari-archive and should turn up any
day now, here is the information:

Easy-Boot v1.5

Written By Steve Wells. (Me!)

Ever tried a new TSR or ACCessory on your Hard-Drive, only to find that it
doesn't work properly on your system, and the whole thing crashes, with
no way to access the hard-drive other than by loading the driver software
from a floppy disk which you have to spend 5 minutes searching for?

Ever gotten sick of having to move files or rename them to disable them
when you need the extra memory or want to solve a program conflict?

Ever wanted resolution independant desktop setups, with the icons and
applications set up just how you want for each different screen-mode?

Well, now you have a program that can handle all this, Easy-Boot is, as
the name suggests, a very simple, no-fuss, no-frills Bootup manager, that
can turn programs in your AUTO folder, ACCessories, and CPX (X-Control
modular accessories) on & off, and it can also select different ASSIGN.SYS
files for GDOS, and alternative Desktop setup files (Which can be for
the TOS 1.xx desktops, New-Desk (TOS 2.xx to 4.xx), or even for things
such as TeraDesk, Neo-Desk and other replacement DeskTops!).

HOW DOES IT WORK?

Before you can see this, you will first have to set up the program using
the EBCONFIG.PRG Program (Easy-Boot Configurator).

It doesn't matter where this program is loaded from, it will read and write
its data file (EASYBOOT.CNF) to the AUTO folder on the drive it is loaded
from, creating the AUTO folder if required.

After loading the program you are presented with a menu, the commands do
the following:

A) Enables/Disables the displaying and managing of ACCessories on the
Bootdrive during the loading process. If Enabled then you will have
the opportunity to select/deselect any ACC's you have on the system,
if it is Disabled, then this will be bypassed. It will only usually
be disabled if you have no ACC's, or only one or two which you consider
compulsory to the efficient running of your system.

B) The search-path for ACCessories. Usually just '\' (The root directory of the boot-drive) but it can be other paths for use with things such as Geneva which can load ACCessories from alternative directories. These paths are written without the trailling back-slash, (e.g. 'A:\MISC' NOT 'A:\MISC\'!!)

C) Enables/Disables the displaying and managing of CPX files on the Bootdrive during the loading process. This will give you the chance to disable any eXtended Control-Panel Modules that you may have instead of doing so after bootup. This is usually to prevent the rare conflicts, to speedup booting, or give your computer a bit of extra memory to use!

D) The Search-Path for CPX files. Usually '\CPX' (The folder 'CPX' in the root directory of the boot-drive).

E) Toggles the selection of alternative ASSIGN.SYS files for your system. This will read the alternative GDOS setup files from a directory of your specification (see later), and will let you have different fonts defined for use with various setups. So, if you want the full works, you can have 30 or so fonts loaded, but if you want lots of memory, you can just have an ASSIGN.SYS file with only a couple of fonts.

This works by creating your various ASSIGN.SYS files and saving them in the specified storage directory (see 'Alternative File Setup'), with a common extender of your choice.

(I use ASN but they could just as well stick with SYS or anything that you prefer). Then, after telling Easy-Config the extender and path (see later), Easy-Boot, when activated, will let you choose which ASSIGN file you want to use at that time. It does this by reading the desired ASSIGN file from the directory, and replacing the ASSIGN.SYS file in the root directory with the one that you choose, net result being is that you can have dozens of different GDOS setups!

All the different ASSIGN files should have different names, but the same extender, e.g. LOW_MEM.ASN HIGH_MEM.ASN NO_FONTS.ASN ALL_FONTS.ASN etc.

F) The file extender for the alternative ASSIGN.SYS files. This consists of just the 3 letter extender, e.g. ASN or SYS!

G) Toggles the selection of alternative Desktop setup files. If selected then as with the ASSIGN setup, you can select different setup files for your systems desktop. The same method is involved as with the ASSIGN files, create your various desktop setups, and save them under different filenames with the same extender, in a directory of your choosing (see Alternative Files Setup).

Then, tell Easy-Config the path and extender of the files you have created. And finally, the filename you wish them to be copied to. This will usually be NEWDESK.INF or DESKTOP.INF but they could be the setups of any replacement desktop, or even some other form of

configuration file. The files are written to the root directory
of the boot-drive, so make sure that whatever program they are for
can read them from the root-directory. (Usually solvable by running
the program in question *From* the root directory!). If you are
just using the standard desktop files (DESKTOP.INF for TOS 1.xx or
NEWDESK.INF for TOS 2.xx, 3.xx, 4.xx and Multi-TOS) then this isn't
a problem!

As with ASSIGN, different setups should have different filenames, but
identical extenders, e.g. (LOW_RES.DSK MED_RES.DSK 256_COLR.DSK)

H) Desktop Setup Destination Path. This is where the desktop setup files
will be copied to in case you are using a replacement desktop such
as neodesk which expects the setup file to be in its own directory,
(e.g. \NEODESK3). The files are copied from the path specified in
the 'Alternate Files Setup' Menu, so make sure you enter this menu
and tell the config program where you are storing everything!

I) The 3 letter extender for the alternative Desktop setup files, usually
INF as usual, or something else such as DSK.

J) Desktop setup filename. This is what the alternative desktop setup
files are copied to in the root directory. As stated, this is
usually DESKTOP.INF or NEWDESK.INF but it could be anything that
you wanted to use.

K) Display of on-screen help on/off. This will toggle the on-screen
instructions during the use of Easy-Boot. Probably best to have
it turned on for the first couple of uses, and then turned off
once you are familiar with the workings of Easy-Boot, although it
can quite harmlessly be left on permanently!

L) Boot-up Timeout on/off. Enables/Disables the 6 second time-out at
the beginning of the program so you can turn on the machine, and
if you don't press anything, Easy-Boot will be bypassed. This
is of good use for BBS's so the machine doesn't stay displaying the
selection screen after a power-cut! Pressing a key during the duration
of this message will exit the time-out and enter the main selection
screen. Disabling this will cause the main selection screen to appear
immediately for normal use.

M) Alternate Files Setup. See Below!

S) Save the current setup. The selected configuration is saved into the
AUTO folder on whatever drive that EBCONFIG.PRG was loaded from, as
a file called EASYBOOT.CNF.

Q) Exits Easy-Config to whatever it was loaded from. If you haven't
saved the configuration before doing this, the old configuration will
be as it was before modification.

ALTERNATE FILES SETUP
~~~~~~~~~~~~~~~~~~~~
~~~~~~~~~~~~~~~~~~~~

This is really quite simple, basically, this gives you the option to have up to 3 extra menus which will let you select alternative data files for various programs. These can be things like startup-samples, Desktop background pictures or patterns, screen fonts, quotes etc.

There are 4 menu sections in this area, the first 3 look like this:

1) Selection of (1st/2nd/3rd) alternate files:

This will toggle whether you want the selection menu to appear or not. Just like the main menus.

2) Destination Path for (1st/2nd/3rd) alternate files:

Just as it says, this is where the file you select will be copied to!

3) Extender for (1st/2nd/3rd) Alternate Files:

This is the extender that this group of alternate files will have in the storage directory, make sure that the different groups all have different extenders, otherwise you'll end up with several menus with the same files!

4) Destination Filename for (1st/2nd/3rd) Alt files:

The filename that the file will be called when it is copied to the path specified in 2).

These 4 options are repeated 3 times as items A) to L).

The last item is:

M) Storage Path of Alternative Files

This is where all the alternative files, INCLUDING the Desktop and ASSIGN files are stored. When selected the files will be _COPIED_ from this directory to the destination path that you specify. Note that the files are COPIED, so using large files on floppy drives can sometimes take a while! Desktop pictures are usually about 30k on a floppy system you really should use alternative files any larger than this, as even these take around 10 seconds to copy! On a Hard-Drive though, the copying is virtually instant, (For pictures anyway), things such as GIF's etc. that may be over 200K may still take a little while, but it will be faster than much smaller files on the floppy! :)

Basically, it is only recommended to even think about using alternative files larger than about 30K on a hard-drive, as the wait can be quite annoying!

NOTE FOR THE SKIM-READER
~~~~~~~~~~~~~~~~~~~~~~~~
~~~~~~~~~~~~~~~~~~~~~~~~

The alternative Desktop setup & ASSIGN files, and any of the files
that you have specified under the 'Alternative Files Setup'
Menu, MUST be stored in the same directory. This is done for
3 reasons. It reduces the number of storage directories required,
It reduces the size of the code & the program as I don't have
to check for the different paths. And it makes less work for the
user as you can just stick everything in the same place without
having to remember what goes where! Just make sure that the
different groups (Desktop, ASSIGN, Alternate 1, Alternate 2 and
Alternate 3), all have different file extenders or the same files
will appear in different menus!

RIGHT - IT'S CONFIGURED, NOW WHAT?

Well, most simply, make sure that EASYBOOT.PRG is in the AUTO folder of
your boot-drive, and executing as early as possible in the order, so that
programs that you want to disable aren't loaded before Easy-Boot is.
(Neo-Desk 3 has this re-ordering built-in, or AUTO-Sort the PD folder
sorter will do the job. Also, MOVEing all the files elsewhere, and then
MOVEing them back into the AUTO folder in the order you want them loaded
will work just as well - Just make sure that EASY-Boot is run _AFTER_
and Hard-Disk-Drivers etc. and before anything that you might want to
turn on & off!

Once installed, rebooting your computer will startup as normal until
Easy-Boot is loaded. You will then be presented with a 4-column listing
of the .PRG files in your AUTO folder. By using the Numerical keypad
keys, you can move the selecting arrow around so that it points to the
filename that you wish to toggle, the keys are:

8 Up
Left 4 6 Right
Down 2

Once the arrow is pointing at the file you wish to enable/disable, pressing
the SPACE bar will perform the operation. The word 'ON' or 'OFF' beside
the filename will change to reflect whether the item is setup to be loaded
during bootup or not.

Once you have enabled/disabled the programs you want, pressing RETURN or
ENTER will advance you to the next selection screen.

If you have ACC management enabled, that will be the next screen that
appears, otherwise it will be CPX, if not CPX then ASSIGN and if not
ASSIGN then Desktop setups. If AUTO is the only thing that is enabled
(it isn't possible to disable it as that is basically a quite pointless
thing to do as it saves a lot of hassle!), then the program will exit.

ACC Management is performed the same as AUTO management, just select and
toggle which ACCessories you want loaded.

CPX Management, again, is handled in the same fashion.

ASSIGN management is slightly different. Here you have a list of the alternative ASSIGN files that you have available. Selecting one of them and toggling it will cause it to become the one that is used after bootup is completed. Selecting another one will disable the first, and enable the new one. The file that you select will be copied as ASSIGN.SYS into the root directory of the boot-drive.

Desktop-Setup management is basically the same as ASSIGN management, just select the desktop (or whatever), that you wish to use during the next bootup and it will become active. If you don't select one, then whatever desktop setup you had prior to bootup will be what is used!

If you have any of the 3 alternative files menus turned on then it/they will appear next. The same procedure as with the Desktop files, if you want to change the default, then you select what file you want, and it will be copied over and replace whatever file you have specified in the setup. If you don't select anything, then the data file that was being used prior to bootup will be the one that is used after bootup!

At any stage you can quite Easy-boot just by pressing the 'ESCape' key, the setups you have made will be in use.

If you change your mind after completing a menu, then you can press the Backspace key to return to the previous section.

If you haven't got one of the sections enabled, then it will never appear unless you run the Config program and re-enable it! (For instance, I never use the CPX files so the CPX management menu never appears when I use Easy-Boot!)

Easy-Boot needs an 80-column screen to work. The ICD Bootup software has an option to boot in various resolutions, you should select one with 80 columns! The Falcon030 can change its bootup resolution through use of the program 'NVRAM' which changes among other things, the bootup mode of the computer and having overscan mode on or off.

If you have neither ICD or an Falcon030 (Which I don't have :-(then supplied is the program MED_BOOT.PRG will will throw your ST into Medium resolution for the rest of the bootup process. This program probably won't like all AUTO programs, but is does the job for my setup quite nicely! If you want something a bit tidier, then find 'DC-Format', which has an option to put boot-sectors onto disks containing all sorts of useful features, like setting the system palette from the DESKTOP.INF file, turning Write-Verify off, bypassing the hard-disk (And the bootup delay on >=STE's), and, booting up in Medium resolution! It is also a very good formatter!

Well, that's it, the program is really very simple once you've had a look at it, so have a look, and happy booting!

THE POST-SCRIPT

This program is help-ware, I wrote it to help myself, but mostly because there had been a sudden calling for a program like it. So, I figured I could use all the programming practice I could get and wrote what I

think to be quite a good little program! (Especially considering that it does what it does with a filesize of ~10K!).

If you like & use this program, then I would greatly appreciate some form of reply. Be it ~US$5 by whatever method is most convenient to you, a nice postcard, or if you aren't feeling like you can afford it, just a simple E-Mail to me would be nice! (The $5 would be nice, as i'm in debt up to my eyeballs! :)

The program was written using High-Speed Pascal on a 1040STE (TOS 1.62 UK) and as I'm pretty secluded, I haven't been able to test it on anything else, so if you could tell me how well it works on your setup, I'd appreciate it! (Or even if it works at all!).

Should you wish to send me cash or whatever form of correspondence, you can reach me at:

TO DO

Add a selector to change the program which autoboots from GEM (TOS >1.4), tricky to do tidily, easy to do so that 'it works'.
'Sets' like in the brilliant "X-Boot III" from Gribnif Software, which allows entire lists of programs to be enabled/disabled and selected files to be used instead of the defaults, just by selection of one option. This takes a bit more work and would probably increase the size of the program by a couple of kilobytes! This is actually very tricky (to do it _properly_ that is), so I probably won't implement it unless I have 1) Requests to do so, and 2) Plenty of time to do it in!
Perhaps work out how to use the cursor keys instead of keypad for file selection. The only way I've found so far uses the GEM-call evnt_keybd which doesn't work until GEM is initialised (e.g. the AUTO folder boot routine is finished!) so it isn't a lot of use with this type of program!

HISTORY

v.2 Could only handle the AUTO folder, and only up to 23 programs.

v.4 Could handle AUTO, ACC and CPX but still only 23 programs.

v.5 Expanded listing into 4-columns so over 80 files can be selected.
Added support for ASSIGN.SYS and DESKTOP.INF files.
Added display of current management stage.

v.6 Added online 'help' feature.
Made management routines optional.

v.7 Added 'return to previous menu' feature.
Added 'quit without completion' feature (ESCape).

v.8 Improved display and moved location of config file into the AUTO folder.

v.9 Added support for different Desktop setup destination filenames.
Added definable extenders for alternative Desktop and ASSIGN files.

v1.0 *1st Public Release*
Optimised the code, reducing file size by ~800 bytes, and removing 2
screens of source and replacing it with about 3 lines that did exactly
the same thing. (Required alteration of some variables).
Improved checking routines.
Added display of search path for ASSIGN and Desktop files.
Created simple Configuration program.

v1.1 Further optimised the code, reducing the source-size by over 1k, even
after adding routines for 3 'alternative' files and much improving
the selection code. (You now can't select things that don't exist!).
The alternative files can consist of any data file, (Picture, sample,
test etc.) which will be copied from the storage directory to a
destination path & filename of your choosing!
EBCONFIG now has a seperate menu for selection of external files.

v1.5 *CURRENT VERSION* - *2nd Public Release*
Got rid of all sorts of bugs, such as displaying empty directories,
(not a bug, but pointless, so I removed it), X & Y co-ordinate
adjustment (You are now limited to selecting entries that exist!),
Made the ASSIGN option _work_ (An incorrect variable caused the filename
to consist merely of the search-extender, it is now ASSIGN.SYS as it
should be!), and adjusted various other bits 'n' pieces so that they
worked, worked better, worked 'safer', and/or worked 'smaller'!
Added a time-out routine, which can be selected via the config
program. This time-out uses the system clock so should take the
same length of time on _all_ machines. The delay is 6 seconds which
should be plenty of time to react, and just short enough to be
acceptable!
It is now as far as I can see, bug-free!! (Yay!)

FORMAT OF THE EASYBOOT.CFG FILE
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

This file is in plain ASCII because it was the most code-efficient method of
storing it. Plus the fact that some kind soul may want to write a GEM shell
for me as I'd like to get a Multi-Tasking friendly Config' program working,
but I wouldn't have a clue of what you are and aren't allowed to do! :)

DISCLAIMER

I hate these things, but in case some nasty person out there tries to cause me grief, here it is.

I, (Steve Wells), the author of Easy-Boot, Easy-Config, TDSS and Med-Boot, will not be held responsible for any problems caused in the unlikely event that one of these pieces of software should damage any form of software or (I don't know how), hardware on your system. The fact that you are reading these words means you automatically have agreed to waive any and all rights to claim retribution from me for any problems caused through use, direct, or indirect of these items of software.

There, I think that's pretty much all encompassing, but for those who can't be bothered interpreting it, it basically just means that anything that my software does to your system isn't my fault, so there! 8-) However, I would be very surprised if it does anything other that what it is supposed to do without someone doing some very odd things! (Which I won't mention because I'm sure someone will promptly try them! :)

Also, as far as I know, the documentation is accurate, but I may have missed something, in which case, please inform me of the fact! I may have added a new feature or changed something and forgotten to document it, in which case I should be told ASAP!

Excuses aside, let me know what you think, and have a nice week!

Please, anyone that uses this program, let me know so that I know that all my hard work (:-)) was not in vain!

> for long file names...

Ataris (E.Smiths) MiNT/MULTITOS is very close to Unix. Have a look at drive U: and
you will find some Unix simular things. They started to go in this direction, so why not go
further...
On ftp you can find a Unix-like filesystem, shell's, gnu-applications,... if you work with
this programs you will need the long filenames.

one example: i installed a unix partition (minixfs) on my harddisk. now i'm able
to copy files in the background (usefull for backups). try this with the TOS copy
functions from the desktop!

Even if Atari doesn't develop the hardware, wouldn't it be feasible to
use hardware that is already easy to get? I'm not trying to pull a P.
Sinclair here, but couldn't someone just use Apple's Geoport adapter (with
maybe some sort of adapter from the Geoport connector to the DSP connector)?
I realize that it would be WAY too much to hope for Apple allowing the porting
of Geoport to the Falcon, but at least this way someone working on a DSP-modem
need only worry about the software. Does anyone know if the Geoport adapter
has any internal buffering?

Or is this too much work because the DSP-modem hardware is so trivial?
BTW, how likely would it be to make a DSP-modem that does v.32bis and V.42bis
at the same time, let alone V.fast? I wonder this becuase even Apple's Geoport
for the Power PC only supports up to V.32+(MNP5||V.42bis). Is the DSP inthe
Falcon too underpowered to do the calculations necessary to handle some of the
newer modem speeds?

I need some help with Junior Office a Fax program
that I dnloaded from tu-berlin..

Does it work with NVDI..??

I had problems when using it, it would crash..

I replaced NVDI with AMCGDOS, it did not crash...??

Also will it run from another drive than C:

I could not get it to work on anothe drive came up with a STOP
dialog box, with some thing about module...!!!!

Does it support a Supa modem...

Is it any good...??

Thanks.....

|> It's really quite unfortunate that there's all this "wonderful" PPC hardware,
|> and virtually NOTHING to run on it. Very bad for marketing.

- The first PPCs from Apple are able to run all MAC software.
The emulation is very stable and fast.

- With a new version of "Soft Windows", these PPCs can also
run any Windows software at the speed of an Intel 486.

- It is planned that NextStep is ported to the PPC.

(Source: c't, german computer magazine)

Has there ever been a comparable step to make it easy to change
from CISC to RISC?
I think there has never been a better opportunity for so many
users to change the platform without losing the money that they
have invested in their software.
This also is a good basis for software developers. The software
already runs in an emulation mode on the new machine. This gives
them time to adapt the software so that it runs in native PPC code,
and then the machine is significantly faster than a Pentium PC -
but cheaper.

More powerful versions than the 601 are already planned; the entire
processor family will be binary compatible so that once a program
exists for the PPC, it doesn't have to be adapted for the new
processor in order to benefit from the higher computing power.

DA's Vektor contains a reasonable autotracer, and a fine vector graphics
editor. I don't know the US price, it's 149GBP in the UK (249 for
`Pro' version). There may not be that many 2nd-hand copies around, though,
because it's relatively new.

Maybe because a hell of a lot of Atari users are running Minix filesystems and have enjoyed very long filenames for some time now ie many years. That plus symbolic links, full file permissions etc.

Just because you don't need anything beyond 8.3, it doesn't mean the rest of us don't.

I had a wee play with it last night. I was quite impressed that it ran on the
Falcon (this is the demo ver) with only minor tweaking with Backwards.

I got fairly far with level 4 and have concluded it is best to send in blokes to
wipe out the wee missile launchers with missiles. Once this is done things are
much easier. Don't shoot the natives though at they get nasty...

Anybody remember Deuteros? It was IMHO about the best computer game ever released. I used to spend weeks playing it on my Atari ST but now that I'm an Intel drone I can't seem to find it. I know that Millenium (its predecessor) was released for the PC but I've never been able to find Deuteros. Was it even released for msdos? Any help appreciated!

>whole. It's one hell of a computer - and if someone really thinks that it's
>"slow, badly designed, rare and stupid", then the original ST was a
>catastrophe.. ;-) ! So much better is the Falcon, believe it or not.

The ST was in its time (against PC/XT) a good machine. You should look at
the current Falcon's competitors. The Falcon is not a fast machine if you
compare it with a 486DX33, something you definitely need to play Doom (and
the 8 MByte of ram). This doesn't not mean it is a bad machine, but let's
get real now, can we? And since most of us don't really know how effective
the DSP for Doom would be (apart from the music and the like :-), we should
not expect too much gain from it. Even more because the original program is
probably not written to use this kind of parallism. Or can someone tell me
it uses the NeXT's DSP?

>So, people: instead of complaining how miserable a beast F-030 is, go and get
>yourselves one. Rumours and bad publicity are one thing - and reality another.

Yes, that is true. We need to look at the **MACHINE IT SELF**. Why buy a F30?
I'm perfectly happy with my Mega ST2, which I'm currently typing on. But
Let's get real, the Falcon is too little, too late. And I have seen them,
played with them, etc. You can't blame facts on jalousy.

Most of thecoverdisk stuff works OK on my Falcon. I used Calligrapher OK but I
must admit I didn't try evrything as I didn't like it much at all. I'd say they
are *the* best mag for Falcon stuff, lots of their screenshots of stuff in
reviews are done on Falcons and they cover a lot of falcon only stuff too.

: currently available.

: I know about Prism Paint 2 and I am strongly considering it for my purposes.
: But, I would like to know about others that might fit my needs.

: Please note: I have no need for animation and high-end touch-up packages (yet).
: Rather, I'm interested in straight forward graphics packages in the class
: of Deluxe Paint and True paint,etc.
[stuff deleted]
: Currently, I use Deluxe Paint and True Paint and I need more power!
: I know about GEMVIEW for file conversions but I'd also like a more
: stream-lined process (to be able to save a file directly in the format I
: need, etc.)
You might take a look at Rainbow. It's a Falcon specific paint program and
it runs on both VGA and RGB/TV. The basic resolution is 320x240, but
pictures can be bigger than that. The program uses Falcon's hicolor mode
with 5 bits for red, 6 bits for green and 5 bits for blue (=65536 colors).
It's extremely fast and has good features.
You can get a demo from
ftp.tu-clausthal.de:/pub/atari/falcon/graphics/painter/rainbow1.zip

keep falconing,
Chris

Minix partitions under MiNT/MTOS, per chance? I know I would like it,
as half of my hard drive is under minix partitions. Besides, the MAC
and Amiga are not unix-based, but I believe they allow extended
filenames (from what I hear - semi-rumor - that DOS 7.0 will allow
extended filenames as well)...

I heard that OMeN was written on an Atari system to begin with and consequently
is far more advanced than other versions with an expected release in june/july
I believe. It will be shareware BTW.

The last few days I used to program some raytrace pictures with the
PoV-Raytracer.
But it is hard to write complex scenes as ASCII textfile so I'm searching
for a 3D-Editor for the FALCON 030 which exports .pov files.
Is there anyone who can help me ?

If it is possible, please send me this editor.
My E-Mailadress is:
ruediger.busch@informatik.uni-oldenburg.de

Thanks a lot
Ruediger

>Atari geniuses!
>
> In my quest to download files from the Atari@Atari.archive, I've
>run into problems. Nothing I've FTP'ed and saved on an IBM computer and
>taken home has worked yet.

Just curious - do you have Kermit and/or FTP set to BINARY mode?
If not, you'll get corrupt files after the transfer (I don't use
Kermit, but I have on occasion forgot to get binary in FTP,
and a bunch of time gets wasted)...

>I can't use ARC.TTP on anything.

Dumb question - the archives have an ARC extension, right? Make sure
you have the latest version of ARC (6.02ST I think is the latest).
And of course, archives with ZIP, ZOO, LZH and other extensions
need the appropriate archives to work. I believe there is some sort
of starter kit (starter.tos?) on atari.archive.umich.edu to give you
the latest versions of the major archivers... (it's self-extracting -
you run it to extract it)...

> Anyways, how exactly do I format the IBM disk? Size, with/without
>a serial number, with/without space for system files. In short, what is
>the EXACT command I use to format the IBM disk.

FORMAT A: /t:80 /n:9

The above should format a normal 720k (double-sided/density) disk
on the PC.

>From my understanding, I
>do not need to have TOS 1.4 to stick this disk into my Atari and read it,
>is that correct?

Correct - any TOS version should be able to read/write to DOS disks.
To FORMAT a disk to be read under a PC from the Atari, you need to
have TOS 1.4 or later (or use a special formatter, like DC Format)...

>What ARC program should I use to deARC my programs?
>will ARC.TTP work just fine?

See above (starter.tos). Basically, you'll need arc.ttp (arc602st.ttp),
lharc.ttp, zoo.ttp, stzip.prg, etc to get at ARC, LZH, ZOO and ZIP files.
And of course, there are other formats out there to make life
even more interesting :-)

>Also, do i need to use any special commands
>other than GET when I FTP to Atari.archive?

Just to play it safe - after you connect to atari.archive (or
whereever) type "binary" and hit return to set yourself in binary
mode. Some systems default to this, some don't, so play it safe.

> Lastly, can someone give me specific instructions to deARC a program
>once I have the disk on my Atari?

arc -x filename.arc to unARC a file
lharc x filename.lzh to unLZH a file
etc

Or make it easy on yourself - get Arcshell (which gives ya a nice menu
to make your choices from when running ARC and LHARC - basically saves
ya from typing in command lines)...

Hope this helps...

I should be getting my brand-spanking new Falcon tomorrow morning (a 4/128 model with an SVGA monitor), and I have spent the last few days collecting utilities and fixes for it....

What I would like to know is... Is there anything I have missed???

My current 'collection' looks like:

NVDI
Shbuf8 (does this need GemRam? - also how much memory does loading GEM use up?)
Backwards
Rezfooler
Before Dawn
SAM
Xcontrol
Tabby
Screenblaster

Also could anybody tell me of any decent programs/games and so on...

Some thing still on my 'to get' list which I haven't found yet are:

Gem-View & JPEG Decoder
Lasers and Men (Is the finished version out yet?)
3D-Button CPX

If anybody could give me any details I would be extremely grateful, and if possible could you let me know where I could download the programs from!

Many thanks,

Neil.

1093. I need your support (HENSA/micros moderator)

Newsgroup: comp.sys.atari.st
Date: 1994-04-19 14:53:21 UTC
From: vctec@westminster.ac.uk
Message-ID: <CoIHBt.7Ju@westminster.ac.uk>
Source record: 189014
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Dear friends

Just started here at Hensa/micros (micros.hensa.ac.uk) and was lucky enough to
be put in charge of the □Atari section, as well as another one.

Problem:

Hensa have a *.msg file with every package, briefly summarising a few things.
One of the fields is machine type. So far this has just been filled in with
Atari ST, but i would like to bring this up to date. To be filled in with things
like St, STe, Falcon, TT. Here we have a Mega ST2, and at home got a STe
(TOS 2.06, not Mega). I can only test these progs on the machines I got. Falcon
I'll be getting at work, but don't know when yet. TT, out of the question.

What I'd like, if anyone would like to help me, is would you be willin to
test this software on your Falcon/TT? Test it to see if it works, and that it
doesn't crash. That's all. You do not need to test the program in any other way.
By that I mean you do not need to test it for it's GUI, etc.

I look forward to hearing from you guys/gals.

Things to look forward to:

I plan to make the Atari section at Hensa work, and one of the best places for
Atari PD.

A new Falcon section is being planned. It should (hopefully) be up and running
in about a months time.

All facon only software will go in this directory. Soft that works on both will go in the
TOS directory, and MiNT stuff in the MiNT directory. I plan to support
Mag!X and geneva, and OMEn too, if they are good enough to have PD patches etc.

Oh, and the mainframe is changing. The new one...HENSA/micros II (A Sun Sparc)
compared to the first one now (a Sequent Symmetry), will be a lot faster, more
memory, disk space, and support more users on-line.

At the mo, the Atari section doesn't have many people logging in. But I hope,
that from next week onwards....when the new machine is on-line, it will be
bustling. The new machine now supports, ftp, x,y,z modem, gopher, and
World Wide Web.

So come on you guys.....I need your support for the Atari section. Let people
know that Atari is not dead in this country. Log in to hensa

help needed with the following files for Falcon/TT compat:

STZIP2.5/2.4
BoozGEM 2.1.3
LHarc 3.0
Chameleon 1.19
ESS-Code 5.06
Pack_ice 2.40

These files, I installed on the new machine, over the past couple of days. OK,
so half of them are old files, but I felt that I needed to put them on the system.

Source record: 189015

Yes, I have seen the Rainbow 1.0 demo for the Falcon...

I think that it is a nice piece of work and its nice to see specific support
for the bird...however, it is not quite what I was looking for...

First, I'm trying to justify my Falcon as a platform from which I can do
graphics and animation for commercial games across other platforms.

Rainbow's TC features are not quite what I need right now - especially considering the
rather weak zoom and block features of the program. If they were improved and if more
import and export formats AND a US distributor for the program
could be found, I would strongly consider the program. Certainly, the
price is right and it is very fast!

Perhaps the program will be developed further? If so, it would be a strong
contender to the available TC falcon packages.

Ari

> whether the Atari will survive. Stop blowing it out of proportion.

Brilliant. There are many of us here (and on GEnie) who do NOT consider
illegal hacking and phreaking ('h/p' as you so expertly put it) to be
the least bit humorous. What could possibly be funny about THEFT?

Long time users of this newsgroup know better than to tell me (or any
other Atari developer) to 'lighten up' about piracy or other illegal
uses of 'our' machine! Have some common courtesy, will ya? Sheesh.

We HAVE discussed h/p in this newsgroup before, as it is regarded
quite differently in North America and different regions in Europe.
As Rickard Troedson and I have often discussed, a "hacker/phreaker" is
not necessarily a "pirate" ... but they run in very close circles. You
are known by the company you keep, and your cavalier attitude towards
hacking and phreaking doesn't improve your position, IMHO.

You claim that h/p has nothing to do with whether Atari will survive.
That's probably true. But that is exactly the same kind of attitude
expressed by thousands of software pirates who say, "Aw, it won't hurt
anybody if I make just ONE copy of this software." Yeh, right.

You call yourself "dr nightmare," eh? Sounds very familiar... like a
handle we turned up during the IAAD pirate bulletin boards research
last year. RadioCityZen BBS sounds familiar, too. Figures.

1096. Re: Doom for Falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-04-19 15:08:22 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HBCURAUAEG8WYJRK@SNYONEVA.CC.ONEONTA.EDU>
Source record: 189017

Ok, so it seems that there is a split in opinions regarding the viability of a port of Doom to the falcon...well...how about someone trying it anyway? Heck, I'd buy it!

Anyway, from what people have been saying, perhaps the bird is not suited for such a task. Still, the falcon should be well suited for some pretty sophisticated arcade games with tons of 256 color and/or TC sprites!

I've seen 486 PCs struggle with Galaxian type games that display only ten or twenty animated sprites. I bet with the power of the falcon's 68030, its video architechture, and its DSP - it could display dozens of animated objects for some real awesome shooters!

And what about simulators like Aces over the Pacific on the Falcon? I play Lucas Arts Their Finest Hour and it screams on my falcon - mind you, this program is not enhanced for the 68030, the Falcon's video, or the DSP...

Hell, I'd like to see games of the caliber of X-Wing or Flying Shark, etc on the bird and I challenge someone to do it! And, if there's money in it I'll volunteer to draw the graphics as some of you know I can...

If those in the community will commit to buy these type of programs, I'm sure some enterprising developers can be swayed to develop the type of games the Falcon is capable of!

Look, even an existing ST game can be ported over to the Falcon with rather minimal effort (just gfx and audio enhancements) and if only 2-3,000 copies are sold - money can still be made.

Just my say in the matter...

Ari

1097. How to get Spectre 3.1?

Newsgroup: comp.sys.atari.st

>
> Griff
> --

I tend to agree with Griff. Allthough my credits are still to be founded,
I've been working on a game for the Falcon in 256 colour mode. Moving a
32*16 sprite over the screen seems to go pretty fast when done by the CPU,
even with 8 words need to change a pixel. My program doesn't want to change
1 pixel at the time: it changes 16 pixel's at the time, which takes about
the same amount of time as one pixel. A lot can be done by software. I
thought especially Atari developpers we're cunning in doing great things
with software, where other platforms had hardware (and costed more $$$).

Joost.

>for that matter) isn't available, as far as I know.

The player you mean is the mpeg player from Brainstorm, it is quite nice
and can in TC I think do 15 frames per second with a 280x160 sized
animation using the DSP...it was very fast in mono...

The problem is however, that to obtain the license costs way too much, it
was meant to be such that atari obtain the license for atari falcon
computers (similar to the jpeg license idea) but they decided not too, I
believe the cost to obtain a single license now to incorporate this
mpeg code is around 50,000 franc, could be less....

it's still too much to invest for the atari platform though at this stage

Cheers

I fully agree with you. Geneva and Magix have a base of existing Atari software that runs on it. While SM2 maybe a good little programming exercise, I can't really see developers jumping ship to write SM2 apps so that say in 6 months there are 200 SM2 apps,utils,etc. Omen tries to be a jack of all trades(platforms?) and end s up being a master of none. While they may be fun for programmers to examine, for the average Atari user, they are a waste of time and money.

Plenty of info' there.

I've actually paid money for Cannon Fodder, and am quite pleased with it,
I have so far however found no 'secret areas'. But have discovered that
the palm trees and things resembling ferns on jungle levels can be blown
up, and often have useful goodies such as 'Supa Dupa Missile Boostas', which
give guided missiles that can fly _over_ trees and chase after the enemy
until it hits them which looks quite amusing!

I'm up to Mission 8, Phase 3 - so those seemingly impossible levels around
Mission 6 can be done! :)

Devpac DSP is a 56001 assembler/debugger/monitor program, similar to
Hisoft's other Devpac products. It is out now over here (UK), I don't
know about the other side of the pond. It's worth getting if you want to get
into DSP programming, and has a quite nice programming tutorial showing
you how to write a DSP subroutine for matrix multiplication. I found that
the demo files on disk were a bit wrong, but they're easy to get going.

>written for OMEN, so long as the source code was available. This is
>somewhat like Unix.
>
>Is this wrong?

No - you are correct, but UNIX still has a major advantage. People write programs for UNIX because in many cases they have no choice, UNIX is the OS supplied with the machine. The same is true for TOS,DOS and whatever the MAC OS is called ;-)

OMEn OTOH is not standard with any machine and therefore has no default user base. If somebody writes an OMEn specific program there is likely to be only a few thousand users in the *whole world* who can run it! At least with all the other OS, all the other purchases of the same machine will be able to use the software. In the case of UNIX, the portability extends much further than this as porting software between brands of UNIX is reasonably simple.

What about Windows NT and OS/2 before anybody mentions them? They seem like OMEn to the extent they are not shipped as standard with any machine (well if you ignore the DEC Alpha PC for the moment)? However there is a big difference. Both are largely backwards compatible with DOS and Windows software - so already have a large software base.

Roland.

Tech would be for non-programming technical questions, such as "x program
crashes, why?" or "I'm installing y hardware, how?" and the like.

I'm getting a bit tired with this discussion... =-(Falcon may not be a fast machine, measured by PC-world's units (CPU-power, etc.). Nor is Mac, or Amiga. But all these machines do have their clear advantages. It's a pity people seem to envy 486 and Pentium power, forgetting totally that this raw horsepower is all there is.. No DSPs , no Blitters, stone-aged memory handling by DOS... So, that is what we want..? PC-technology..?? Why did we buy an Atari, if all we want is a PC? Sounds quite gloomy - frighteningly desperate.

> >So, people: instead of complaining how miserable a beast F-030 is, go and get

>
> Yes, that is true. We need to look at the **MACHINE IT SELF**. Why buy a F30?
> I'm perfectly happy with my Mega ST2, which I'm currently typing on. But
> Let's get real, the Falcon is too little, too late. And I have seen them,
> played with them, etc. You can't blame facts on jalousy.

I still have my accelerated, tuned-up Mega ST4 in the corner, waiting for its buyer. Don't speak of jealousy - that's not the word. I used to think just like you, myself, not long ago. My Mega was faster than F-030 (on paper, at least), the keyboard was better, etc. I thought: "Why waste my money on a 16 MHz, STE-cased box..?". Especially, after using TT's at work.

So, what happened? I went nuts..? O.k - let's put it this way: after I finally got an offer that was very attempting (price), and took the risk: bought the bird.. After some tuning-up, and getting used to this totally different computer, I just realized that it's much more fun to work (or play) with the Falcon, than it was with a Mega, or even TT. My old, faithful (well, quite..) Mega just suddenly felt rather gray and uninspiring. It's frighteningly easy to fall in love with Falcon... You just won't believe it, until it has happened - you're kinda caught.

Maybe it's the birds versatility - maybe the new OS, maybe that all together. But it's a very inspiring computer - much more interesting than you ever can think from those technical details..

So, why I'm getting tired..? Because - honestly said - the atmosphere here, in the Atari-areas, is DEPRESSING... Nobody believes in anything, nobody has optimism left, nobody wants to try anything new... So, if this funeral feeling predicts anything (and Atari-users really prefer older machines over newer..), then it really is no use trying to kick people's asses. No use trying to create some "US-feeling". In this gloom what Atari needs, is some spirit, will to have new computers and computer games, will to keep people's heads up. But...
You understand, what I mean.

Thanks for all of You, believing in this "Doom for Falcon" -thing. It may, or may not be impossible - but it's surely something worth acting together. Computer world needs some crazy things, too. Otherwise we all would buy a PC - like those "sensible", risk-avoiding, dull people do. With machines like Falcon, computing feels a bit more colorful than without them..
And who has said that computing shouldn't be fun..?
Falcon is fun. Very thoroughly. ;-)

1122. Fuzzy Logic tool for the ST line

Newsgroup: comp.sys.atari.st

Hi!

My company, Commercial Intelligence Inc., is currently developing a fuzzy logic development tool which will sell (probably for less than $200) on the DOS (and proabably Windows) platforms. Is their any interest for such a product in the ST world?

Will Dwinnell

It looks like you are trying to justify the mistake you made in bying
a Falcon, well I am glad I did not wast my hard earned cash on such a
piece of crap...

If it was such a great computer then there would have been better support,
and software, this tells it all, it is not a good computer for its price...

Good computers SELL this one did not sell at all, facts not fiction....

I can get a TOP 486 with all bells etc for 1/2 the price than a basic Falcon
cost here, plus I get all the software and support I need..

No ! no one can kid me that the Falcon is the way to go, unless you are
mental..

1132. need help w/ Cumana OSK v2.3 for Atari-ST plz?

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 01:42:34 UTC
From: paulseniura@delphi.com
Message-ID: <BSxML+q.paulseniura@delphi.com>
Source record: 188855

Sorry to bother y'all again. I'm still trying to get my OSK v2.3 from Cumana (Atari-ST) talking to my SCSI drives. They're connected to ICD's host adaptor as SCSI IDs #0 & #2. They work 100% just fine with Atari TOS/GEM and ICD's drivers (v6.2.3 currently). But OSK gives me "Not Ready" errors on some files esp. big/large ones. And OSK doesn't like to do a "physical" format. But the STHD driver from Cumana (Reccoware) *can* see the drives and report their correct SCSI info (via FORMAT and FREE) -- honest.

When I posted this plea for help a couple of months ago, one person in Germany suggested I patch STFD (not STHD?) at offset $8E0 to make it $20 or more. Without any further details than that, I didn't do this (for obvious reasons!). So here's the IDENTs on these two modules as delivered by Cumana:

```
Header for: stfd
Module size: $CC6 #3270
Owner: 0.1
Module CRC: $A3FDB2 Good CRC
Header parity: $1E39 Good parity
Edition: $15 #21
Ty/La At/Rev $E01 $A001
Permission: $555 -----e-r-e-r-e-r
Dev Drv, 68000 obj, Sharable, System State Process
```

```
Header for: sthd
Module size: $A9C #2716
Owner: 0.1
Module CRC: $C45E91 Good CRC
Header parity: $1E46 Good parity
Edition: $1F #31
Ty/La At/Rev $E01 $A000
Permission: $555 -----e-r-e-r-e-r
Dev Drv, 68000 obj, Sharable, System State Process
```

Another person (from France) thought I should get ICD's latest adaptor. I don't see why because the one I have can honor the SCSI commands just fine. And/or I should get OSK v2.4 -- talk about money I don't have!

Then Cumana told me they'll do some more testing -- I haven't heard back from them at all for 2 months almost. (I've stopped calling/faxing them since my phone bill grew to over $140 one month -- effectively doubling the price of this package!)

I don't see why I'm having so much trouble getting help! The two drives are a Seagate ST277N and a CDC 96-meg, and both are very reliable and quite fast for my purposes (never big enough, though, ya know). ICD's partitioning software can even make the part'n info AHDI-compatible. And.. it all *almost* works with OSK.

-*-

I'm also still inquiring on how to buy G- or K-Windows for this Cumana flavor of OSK. V2.3's "console" driver does support a Get/SetStat call to deliver the address of the screen memory, so I'd think we'd be able to run a window/gfx package. (Sadly that's all I know about the technical details -- Cumana only sent me Microware's v2.1 tech docs, not v2.3 or any Atari-specific tech docs.)

I'm about to give up, folks. I'm already hugely miffed how the CoCo/L2 support has withered. Those of you who know me, I want to write some MIDI packages (and you know why :) but I need gfx & windows! If there's no GW/KW for Cumana, just say so! I'll ask Cumana to give me my money back and you'll never hear from me again! This is getting way too expensive for a home hobbyist!

-*-

Thanks for putting up with me again. Please send me e-mail if you've got any clues I could try. I'll certainly appreciate it.

. -- thx, Paul Seniura (from Oklahoma City)

> Ok, spectre 3.1 is out... awesome, but how do I get it?
...
As I read it, Dave Small's announcement states that 3.1 is finished,
and that it will be released when it is documented and duplicated.
He will post something on Genie when that happens, telling how to
get 3.1 . If he permits it, someone will probably post the
information in c.s.a.st soon thereafter. Given the great interest
in 3.1, and people's frustration levels, I'd expect GBS to publish the
ordering instructions only when they have a substantial stock of the
product ready to ship.

1136. MARKET SURVEY

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 03:50:01 UTC
From: sngmedia@world.std.com
Message-ID: <CoJHBE.C26@world.std.com>
Source record: 188864

We are a small, dedicated group of people desperately trying to get a video production company off the ground.

Recently, we secured enough financial backing to produce several videos on the subject of personal computing.

Because we don't have the financial resources to perform a traditional market analysis, we considered several alternatives and concluded that we should consult the people of the Internet, who are technically proficient and tend to be enthusiastic personal computer users.

We would like you to indicate which three of the below described videos would appeal to you most.

Please note that each video synopsis is numbered. When you are ready to send your response, please specify the numbers corresponding to your three video selections, and use commas to separate the numbers.

For example, if you choose selections four, eight, and eleven, the body of your letter would simply be:

4,8,11

and nothing more.

When you send back your response, please specify "MARKET SURVEY" in the subject field. Then, direct your response back to sngmedia@world.std.com.

Please realize that this is not an advertisement, or solicitation. We simply would like to know your response. You will not be contacted further.

Thank you in advance for your help and cooperation.

Tom and Randi Fecker
sngmedia@world.std.com.

Please select three videos that interest you most:

1. The Internet Pilot's Guide
A plain English guide to getting around on the Internet by veteran users. How to use Internet resources to send/receive e-mail, and to search for documents and files relating to a particular subject. How to use LISTSERVs, GOPHER, ARCHIE, WWW and WAIS. How to use FTP and Telnet to access remote computers for file transfers, remote

logins, etc. Also, learning how to observe Internet's "netiquette." And how to access multimedia Mosaic bulletin boards.

2. How to Make Money at Home With Your PC I -- Successful PC-Based Businesses
Meet five successful entrepreneurs who started their own home-based businesses using a PC. Includes businesses that provide typing services, mailing list management, horoscopes, bookkeeping, and even a software developer who does not know how to program -- he hires other people to implement his software designs. Includes ideas for two dozen home-based businesses you can start using your PC.

3. How to Make Money at Home With Your PC II: Portfolio Management.
Whether you manage your own portfolio for investment gains, or you take on clients for a consulting fee, a PC can give you powerful tools for portfolio management. Meet three successful home-based portfolio managers who use their PCs to maximize profits. They'll inspire you, and share some tricks of the trade that can help you land clients and get started. We'll also show you how to determine which software applications will meet your needs, and which online services will satisfy your requirements.

4. How to Make Money at Home With Your PC III: Telecommuting
Learn how to use your PC to telecommute to companies across America that are looking for specialized consultants with skills like bookkeeping, software design and programming, editorial and script writing, technical proofreading, graphic design, copywriting, and more. Includes interviews with three successful telecommuters who use their PCs, faxes, modems and phones to serve distant clients, and information about a telecommuting referral service that could help you find employers.

5. How to Upgrade Your Hard Drive, Step-By-Step
From choosing your new hard drive, through ordering, installing and testing it. This plain English video shows you how to do the job correctly, one simple step at a time. Using industry-wide standards, we'll show you what all hard drives have in common. Includes how to determine if your controller will support a particular hard drive. How to remove the old drive, and install, format and test the new drive. Includes a discussion on the differences between the various standards.

6. How to Design Your Own PC
You don't have to be an engineer to design and build the PC of your dreams. This plain English video shows you how to figure out the PC design that is best for you, how to specify components, how to make sure they'll work together, and where to buy them. You'll end up with a top quality system that will save you money.

7. How to Build Your Own PC
Once you've designed your PC, we'll show you how to build it. The

actual process will take you only a few hours. Using an easy-to-understand method, we'll show you how to inspect, install and test components. Includes tips and tricks from computer production experts. The technical skills can be easily mastered by almost anyone, and you probably already own most of the tools you would need.

8. How to Increase Your Computer's Memory

This plain English video shows you how to determine whether your computer memory can be increased, and how to do the job correctly, one step at a time. You'll learn about industry-wide standards for memory, how to configure additional RAM and cache, how and where to buy RAM chips, and three ways to eliminate low-quality RAM chips. Covers all phases of the process from opening your computer, to testing your memory. Includes discussions on how to ensure your DOS set-up is able to access all available memory, and how to use various memory management software applications.

9. How to Use MS-Windows 3.1

This powerful graphical user interface can help you work smarter and faster, but the manual and the online tutorial that come with Windows leave many questions unanswered. This plain English, step-by-step video will show you how to install Windows on your computer and set it up to get optimum performance.

10. How to Find a Job in the Information Age

A PC can give you an incredible advantage when you're searching for a new job -- or even a new career. But you have to know just how it can help you. In this video, an experienced employment counselor will show you how to tap the power in your PC to find job leads, create a winning resume and customized cover letters, tap into databases and find bulletin boards that will lead you to job openings, and use online services to research potential employers.

11. How to Install a Sound Card in Your Computer

Here's how to add incredible stereo sound to your computer with step-by-step help. In plain English, you'll learn how to determine if your computer can support a sound card, how and where to buy a high-quality sound card. How to open your computer, and install and test the sound card.

12. How to Install a CD-ROM Drive in Your Computer

Using simple tools, this plain English video shows you how to install a CD-ROM Drive in your computer. You'll learn how to make sure your computer can support a CD-ROM drive -- and what to do if it can't. Covers internal vs. external drives, how and where to buy a high quality CD-ROM drive, what you need to know about differing industry standards, preparing the drive bay, testing and trouble-shooting. Covers SCSI and IDE.

13. How to Fix the Most Common Computer Problems

Your computer serviceman may not want you to know this, but all you need is the know-how you'll get from this video, simple tools, and

easily-obtainable diagnostic software -- and you can fix most common problems you'll ever encounter with a PC.

14. What to Do When a Virus Strikes Your Computer
Viruses can come from almost anywhere: a colleague or friend's disks, a network, a bulletin board, even commercial software. If you ignore the first warning signs, a virus can wipe out your data and permanently damage your computer's memory. In plain English, this video will tell you how to scan disks for viruses, how to check downloaded files from bulletin boards, how to set up a virus prevention program for your home or office computer, and how and where to buy the best anti-virus software. We'll also cover the pros and cons of the antivirus software in DOS 6.X and Windows 3.X, how to use antivirus software, and more.

15. How Your PC Works: Inside the Case
Here's a down-to-earth explanation of how your PC actually processes information, and what really goes on inside the case. You'll get a guided tour of the insides of a PC, learn about how the various components work and how they communicate with each other, and get a clear explanation of technical terms. A must for anyone who wants to really understand how to program, use and repair a PC.

16. How to Create Config.Sys, Autoexec.Bat and Batch Files
These basic files can make it much easier to use your computer -- or cause incredible headaches if they are not written properly for your particular software and peripherals. Now you don't have to be at the mercy of murky tech manuals, because we'll show you how to create files that work for your system -- step-by-step, in plain English. You'll learn how to write, modify and test Autoexec.Bat and Config.Sys files; and how to create batch files.

17. How to Add a Modem or Faxmodem to Your Computer
Here's the easy way to add a modem or faxmodem to your computer, with step-by-step guidance from this plain English video. You'll learn how to determine if your computer can support a modem or faxmodem, and what to do if it can't, how to choose and buy the best modem or faxmodem, how to open your computer, and install the modem or faxmodem, how to test it, how to quickly eliminate common problems, and how to set your modem or faxmodem correctly.

18. How to Make Money at Home With Your Computer
The information age is opening up incredible new opportunities for PC owners to make undreamed of money, using skills and knowledge you may already have! Here's inside information on the ten most promising telecommuting jobs and 12 small businesses you can run right from your home, using your PC. Includes profiles of PC owners who are actually running PC-based home businesses.

19. The Super-Highway Roadmap
This is your guide to where to go and what to see. You can make

incredible contacts and gather powerful, valuable information on the Internet, but the problem is that most people can't begin to imagine the potential of something that seems so abstract. This plain English video will introduce you to the Internet, and make these opportunities concrete. Includes interviews with 7 people who did the impossible by gathering information and making contacts on the Internet.

20. How to Upgrade and Repair Your PC I: Basic
This is the video your repairman doesn't want you to know about! Since the components of most PCs are highly modular, PC repair is easier than you think. Just pinpoint the problem component, unplug it, remove a few screws, replace it, and presto! You're in business again. This step-by-step video shows you how to pinpoint problems and replace your PC's components, using ordinary household tools.

21. How to Upgrade and Repair Your PC II: Multimedia
Here's how to save big money on a PC with all the latest multimedia peripherals. You learn how to determine if your PC can be upgraded, how to upgrade your video card and bus, and how to add a CD-ROM drive, sound card, video accelerator, and more. Presented in plain English. The procedures you'll learn require ordinary household tools -- nothing fancy!

22. Plain English Guide to DOS 6+.
The powerful sub-programs buried deep within DOS 6.0 and higher can help you work smarter and faster, but the manual and the online tutorial that come with DOS leave many questions unanswered. This plain English, step-by-step video will show you how to install DOS on your computer and set it up to get optimum performance. In addition to DOS commands, you'll learn how to use the shell, defragmentation, scan and antivirus programs that come with DOS.

23. Home Financial Management on a PC.
Your computer can help you create and manage a budget, keep track of your credit card accounts, handle your tax deductions, and reconcile your bank accounts. But that's not all! You can also determine whether you should pay down your mortgage, finance a new car or pay cash, buy or rent your home, and how much you'll need for retirement. The financial information your computer can give you might mean the difference between just getting by and a very comfortable lifestyle -- if you ask the right questions and use your PC to develop a financial strategy.

24. The Online Bulletin Board Guide
Bulletin boards can be the on-ramps to the Information Super Highway -- if you know how to access and use them. This step-by-step guide shows you how to find bulletin boards, set-up your modem, log on, find out what they have to offer, find bulletin board users who share your interests, search for information, and upload and download files.

Thank you.

I've just downloaded Lasers and Men v1.0. It runs reasonably fast with some really spectacular graphics! Now, I'd like to see it as a $30 US full commercial release and I see it as a best-selling piece of Falcon software.

The program is essentially a Wolf-3d clone and it works well - so why can't DOOM be done (technically)?

Nice job to the L&M author!

Ari

The deal is this, the MONITOR is you're problem! Bet it's a
SC-1224, right? Some of the Color monitors will not support
running at 50Hz. Sorry, as I have quite a few friends who
have the same problem that you are experiencing.

Try this, get SYSTEM_E.PRG a try or another HZ changing
utility and try 50Hz. If it happens like the rolling again,
thats you're problem, the monitor. Also try it on another
monitor.

On the mirror site src...uk all self-extracting files (.tos) are
compressed again. Really stupid because archivers like STZip, LHArc
and so on are the one and only reason for using self-extracting
archives and you need compress/gzip if you want to dearchive it...

Actually I was going to release it as an article in Falcon Update .. ;) ...

IT has to do with the difference between a VGA signal and an RGB signal .. you have more CPU time to play with on an RGB/TV, and you can do higher TC modes.

|> ST....
|> Thanks

I suggest mine (hey, what a surprise... manic self-publicist at work): the V11 JPEG viewer. Currently version 2.18a is available from Umich and its mirrors. The good old 030 version is totally PD, whilst you can register for the DSP version which does JPEG's about 5 times faster.

Interlaced GIF support is not quite right in 2.18a, but has been fixed for later versions. Anyone who desparately needs it can mail me for a slightly newer 030 version... as long as there aren't hundreds of people who want it that should be OK.

Dave

1145. Friend looking for a used hard drive

Newsgroup: comp.sys.atari.st

A friend of mine is in the hard drive market. He would like to get a cheap, used, SCSI hard drive with a host adapter, case, power supply, and cable for his 1040 STf. In other words, plug and play. If he has to buy an ICD Link, that's okay.

If you have such a beastie, send me e-mail and I'll let him know about it. He doesn't have 'net access so the process will be slow.

adTHANKSvance,
Kenneth Love
kllove@mailhost.ecn.uoknor.edu

1147. Re: Archive 2150S tape drive ??

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 08:29:00 UTC
From: Steffen_Engel@pe2.maus.de
Message-ID: <199404201029.a50617@pe2.maus.de>
Source record: 188870

Hi Steve,

Z>Has anybody had any experience running a Viper (archive 2150S) tape
Z>drive from an Atari ST(e)? Any special software required?
The Archive works fine with a normal DMA-Hostadaptor (as the ICD) with
GEMAR.

GEMAR is a Backup software for SCSI-Streamers on ST/TT/Falcon.

An XFS- and device-driver for MiNT is in the package, too.

Look for GEMAR220.LZH or GEMAR221.LZH (minor changes to 2.20) on ftp:

ftp.uni-erlangen.de : ./archiver/gemar220.lzh
ftp.tu-clausthal.de : pub/atari/disktools/tape/gemar220.lzh

Ciao, Steffen

1148. move.l (a0)+,(a1)+ vs. move.l -(a0),-(a1) (Was: Re: Doom for falcon?)

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 08:32:22 UTC
From: schwab@ls5.informatik.uni-dortmund.de
Message-ID: <SCHWAB.94Apr20103223@issan.informatik.uni-dortmund.de>
Source record: 188871

In article <2oh18i$1dh@vishnu.jussieu.fr>, bourlon@gla.ecoledoc.ibp.fr (Marc BOURLON) writes:

|> }|> can move to mem, and with move.l (a0)+,(a1)+ it can put ca:68400kb/vbl.
|> }
|> }move.l -(a0),-(a1) is faster.
|> }

|> What ?????? It's new, then, coz' it wasn't the case on the 68000. And I
|> think seriously that it's wrong. I'll check it if think about it...

|> MB.

From my 68030 book (fea = fetch effective address, no wait states):

head tail i-cache case no-cache case
fea (a0)+ 0 1 3 (1/0/0) 3 (1/0/0)
move src,(a1)+ 2 0 4 (0/0/1) 5 (0/1/1)
total 0 0 3 - 1 + 4 = 6 3 - 1 + 5 = 7

fea -(a0) 2 2 4 (1/0/0) 4 (1/0/0)
move src,-(a1) 2 0 4 (0/0/1) 5 (0/1/1)
total 2 0 4 - 2 + 4 = 6 4 - 2 + 5 = 7

So move -(a0),-(a1) itself is not faster than move (a0)+,(a1)+, but it
can overlap with the previous instruction by two clock cycles. Data
cache hits reduce both the tail and the execution time of fea by one,
resulting in the same total number of clock cycles.

1149. Re: Help FTP,Kermit,IBM->ATARI. Thanks!

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 08:34:58 UTC
From: mcwilliams@wmich.edu
Message-ID: <1994Apr20.033458.17516@wmichgw>
Source record: 188872

Hello there...

Right, your problems are probably due to transferring the files as ASCII instead of BINARY at both stages of the transfer.

First of all, when you are FTP'ing to atari.archive you should type 'bin' at the ftp> prompt. You may also like to type 'hash' at the ftp> prompt, so that you can monitor the transfer. This must be typed in every time you use FTP, but is not necessary before each file you transfer. This will ensure that the files get as far as your UNIX filespace in their binary format.

Then, when running KERMIT, you need to place both versions of Kermit (on UNIX and on the PC) into BINARY mode. I think you type 'set filetype binary' or something similar. Having done this, you can use 'SEND' and 'RECEIVE' to get the files you want onto the P.C. Alternatively, you can type 'server' on the Unix Kermit and then 'get *' on the PC to get everything from your UNIX directory. You may want to make a subdir on your filespace to be used for files you are transferring.

By the time the files are on the PC, you will need to make some 'Double Sided Double Density' (DSDD) disks ready to transfer the files onto your ST. This is done most easily from the PC, but unfortunately, I do not know the exact DOS command to do this. It is probably 'format /t80 /s9 a:' although I do not use DOS myself.

If your PC's have Windows installed, then run the Windows file-manager, then under the 'Disk' menu, there should be an option 'Format Disk' which will give you the option of 720K. Select this, then the disks will be formatted correctly. Also, any DOS file manages (e.g. DOS SHELL or PC SHELL) should have a similar option.

To format disks from the ST (assuming you have TOS 1.0 or 1.2) which will be readable on the PC, look out for a program called 'PCFORMAT' in the archives. Most other formatters will do this, but you will have to ensure you have seleced the correct options. DCFORMAT, FCOPYIII, REDFORMAT, DIAMOND FORMAT, SUPER FORMAT are just some of the formatters which will cope with PC compatible disks.

In short, you want to select:
Sectors (per track) = 9
Tracks = 80 (00-79)
Sides = 2
Capacity =~= 720K (or 0.72 Mb)
IBM/PC/MSDOS compatible Bootsector ON

Of course none of this is relevant if you have a single sided drive, which is a (slim) possibility. If this is the case, you should upgrade a.s.a.p. to a Double Sided drive. This should cost you no more than the US$ equivalent of 50 UK pounds.

Hope this helps,

--
Steve Taylor.

1151. monitors for STe - advice needed

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 09:19:16 UTC
From: FSCSH@BSV199
Message-ID: <1994Apr20.091916.11510@def.bae.co.uk>
Source record: 188874

Stewart Hilson - Stewart.Hilson@def.bae.co.uk

I'm looking for a colour monitor (2nd hand) for an Atari STe to use
in low and medium resolution. Any advice on which are good buys?

have the option of buying a Microvitec Cub:

model 300-114/Standard Res 2/425(H)x585(V) pixels/0.62 dot pitch

is it any good?

How about the colour monitor supplied with an Amstrad CPC464??

Anyone know whether PC (VGA/SVGA/Multisynch) monitors can be used
or adapted for use?

Also looking for a Hi-res monitor (again 2nd hand) - I've heard
Atari's own models are excellent but difficult to obtain. Also
seen a cable that can run a VGA in Black & White Hi-res. Any
advice out there?

Thanks a lot.

Stewart Hilson - Stewart.Hilson@def.bae.co.uk

1152. Re: Doom for falcon?

Doom is doomed?

Instruction cache, data cache!

Of course it fits into the instruction cache! But i can tell you out there
that havent yet realized that you should turn the data-cache off if you
arent going to use it. Cause then it doesnt have to transfer that 256 bytes
every time , and you'll get some extra time to do other things. Remember
also to put your buffers on even adresses(longword).

I don't want to be critical or so but , Lasers of men in 320*200-mode =>
5 frames/sec, unplayable in my opinion. That means that Doom in 320*200
with this technique , ca: 1frame/sec. Wooooow thats fast!!!!!
Lasers of men is GREAT work, but it's ment for 160*100-mode.

Griffs technique could be something , but i dont think the DSP-mem/Cpu-mem
swap can handle this amount of data?

This is my opinion, you may have another?

Bye!

>I'd like to program but I hate to comment or document anything. ;-)

Too bad...

>This library was developed for my own personal usage. It has been released
>because some people have been (and are) interested in the library and
>especially its sources. So if you don't like it you've to look for another
>library. But I don't know if there's another library which is freeware and
>I doubt that all sources will be available.

There is, but it isn't documented either :-(. Although the source code
is commented. :-). I'm talking about 'gemlib' here, a Dutch product...
Would it really be that hard to add one or two lines per function, describing
the function parameters and return-value? Can't be too difficult or too much
work if you wrote it yourself... :-) and I'm quite sure you would do many
others a *huge* favour...
E.g. when I see something like
void dial_colors(int d_pattern,int d_color,int popup,int hotkey,int check,int
radio,int arrow);
I really feel a kind of headache starting :-). A short description would be
a real blessing -- just something like
/* d_pattern: number of pattern according to... (?)
d_color : color-number (0-255)
popup : rsc-index of popup-menu tree
... etc ...
*/

>P.S: Version 1.40 has just been released... ;-)

Where?

For Sale: Falcon030 4Mb RAM, 65Mb Harddrive
Software on disk and harddrive, RGB and VGA connector,
some developer doc's, fully boxed and in mint condition
no pun intended).

Offers around 660 UK pounds.

I also have a SVGA monitor which I may sell as a package.

Regards Kev.

Sorry, but I can't help you. But I'm also interested in such a program on an
ATARI System. (I'm also a (more or less) happy Falcon-User :-)

Bis denne,
Christian

: It's quite fast, too. Backup is about 4 MB/s.

Really ?!
Is it 4MB/s or 4MB/min ?
Putting back 4MB/s to your disk would be very near the limits even of a TT (if you want them sortet in directories).

Stefan.

1158. Re: Using Multimedia CD-ROMs - INTERESTED

Adding MiNT + the minix filesystem gives your Atari long, case-sensitive
filenames that are _still_ visible and usable by programs than can only
handle the braindead DOS FILENAME.EXT format.

Wouldn't you rather have "Rogers-great-story.doc" instead of
"RGRSGSTR.DOC"?

One thing Ansiterm does is give a typical ST user (without a graphics card) a way to get full-screen 16 color ANSI. Besides, I got through the first two years of college using a program with a "similar" hack called Vt100 (and Kermit-65) on the Atari 8bit (and that was with a TV and not monitor - ack :-)

I'm generally not worried about full color ANSI, but the couple times I tried Ansiterm out, it did a nice job...

Message-ID: <CoK7xD.6nx@cogsci.ed.ac.uk>
Source record: 188887

I called a peripherals supplier today to ask about floppy drives for STs, and he said they're not standard 1.4M-style drives. I thought they were - anyone know for a fact? I know the older drives were 360K, and so on, but what about the current ones? Mine's an Epson - SMD, I think.

BTW, I don't actually want a drive for my ST - it's just that I tried the one from the computer in place of my broken synthesiser drive, and as it worked fine I thought about getting an ST drive as a replacement.

>The desire to program games is originally what got me interested in the
>damn things (ie, computers) in the first place... ;-)

That's not so bad.. when I bought my first ST it came with a mono
monitor. Now I have a Mega STe and it STILL has a mono monitor! I AM
working on a switchbox for a Nec 3D but until that time, my gaming is
very limited and the ST is definatley a working class computer in our
home.

Now you should see the mono games that ARE available.. Shocker II,
Oxyd.. very cool.

I've heard Diamond Back III is supposed to support tape backups as
well. If you have DBII, then upgrading is only like 20 bucks... might
be cheaper than shareware.. might not.

Have you, or anyone else ever tried connecting two drives to the
internal host of the Mega STe? This could be very helpful in
upgrading to a new hard disk where you could just copy files from one
drive to another.

>Fairly clever piece of work, actually. And by all reports, it's compatible
>with 'most' Mac software. Would be handy to have an Atari utility like this
>considering the demands of MultiTOS.

Actually, what RAM Doubler is is simply a *smart* Virtual Ram settup. And yes, it works *extremely* well. What it does is a) allows the Mac to use fragmented memory, b) redirtributes available ram between programs in a dynamic manner, c) begins swapping ram to disk only when these other methods have finally hit the limit of your actual physical ram. So, for example, if Photoshop is running with 6megs, but only using 2 (ofr now), it can assign the other 4 to, say, Word 5.1. Then, if you load more images into Photoshop, it will look at Word 5.1 and see if it can take any memory back from Word again. Finally, if Word and Photoshop are both actually requiring all the ram alloted to them, it will begin swapping to disk.... Very slick. You can also hack it with ResEdit to change the multiplier.

1178. Bitstream Cheapo Font CD

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 15:43:55 UTC
From: jonal@dhhalden.no
Message-ID: <jonal.2067.2DB54DBB@dhhalden.no>
Source record: 188898

Bitstream have just released a 500 font CD-ROM with the fonts in both Type1
and TrueType formats. This index was posted in comp.fonts and lists all the
fonts in the package. DA's Vector users can convert the fonts into .DFN format
fonts (although I'm not too sure about the legality of converting the format).
Best part: it's $30,-. Now, if we could convince them to do a Speedo version
for the same price...

Does this imply that there is a problem with some host adaptors? I have an
ICD AdSCSI and an older ICD host adaptor. Do you know of any problems with
either of these (using this particular tape device)?

1180. Re: The best & worst ST game

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 16:12:00 UTC
From: Olaf_Kaiser@bi.maus.de
Message-ID: <199404201812.a21392@bi.maus.de>
Source record: 188900

Hello,

the best games I have seen on a ST are:

- Monkey Island
- Loom

Best regards
Olaf

1181. Spectre 3.0/AJAX/HD Drive (HELP)

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 16:58:04 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CoKHss.LLt@watserv2.uwaterloo.ca>
Source record: 188601
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just got my TT upgrade to TOS 3.06 and had an AJAX and HD drive installed
It works fine except with SPectre 3.0 - it won't read or write or format
mac disks - everything gives an initialization error (all disk are Low Density).
It this normal? I assume 3.1 will allow R/W/Fmt of all mac high and low density
formats? I know that the AJAX chip didn't exist when 3.0 was released so
this may be the problem?

Thanks for any help,
Sam

> OF COURSE THERE IS!!! Keep me informed.

This is an off topic about cdrom drives. I received my MacWarehouse catalog.
Front cover of the catalog shows a dual speed tray loading cdrom external drive
for $199 plus $3.00 over night shipping. Since the Falcon is SCSI equipped,
should work. MacWarehouse can be reached at 1-800-622-6222.

Hello world!

A guy in Aachen, Germany, has developed a RAM-extension for _all_ ST(E)-
models. Up to 12 megs in ST's and up to 10 in E-models. No software drivers
needed. And the added RAM is normal RAM, _no_ TT-like fastram.

His email address: *Martin_Wevelsiep@ac3.maus.de*

I think I've got to answer, now! <grin>.

: The problem is however, that to obtain the license costs way too much, it
: was meant to be such that atari obtain the license for atari falcon
: computers (similar to the jpeg license idea) but they decided not too, I
: believe the cost to obtain a single license now to incorporate this
: mpeg code is around 50,000 franc, could be less....
: it's still too much to invest for the atari platform though at this stage
: Cheers
: Yat

Hi Yat,
You're right about everything but price. It was $50,000, not francs :-(
(remember: the player is only able to play I-frames, not P/B frames and no
sound. The price included a 6 month development to make it a full MPEG1
player).
And you're right also when you say it's too much at this stage. So we
decided one month ago to include AVI, QuickTime and MPEG 1 formats in our
Movie100 FLC player, and then to make it a commercial (at least shareware)
product when this will be done. So you can expect to see something running
some kind of Mpeg on a Falcon someday.
We think it could be possible to have a full MPEG player on a Falcon, but
it's not 100% sure. We'll have to cheat the MPEG norm in many ways to do so,
as the Falcon is just not fast enough (but AFAIK the Windows Mpeg player
do this too).
One more thing: don't expect it shortly, because the 6 month development is
always in front of us, and as we wont get paid for this, we wont work hard
to make it quickly..
That's enough of my bad english for today,

Laurent Chemla @ Brainstorm

:
: [...rest of text deleted...]
:
You must set your FTP to binary transfer (type "binary" at the prompt).
Also, your Kermit must be set for binary file transfer (type "SET FILE
TYPE BINARY" at the prompt).

To format a DSDD diskette for use on the Atari ST series of computers
using DOS 5.0 and above on your IBM PC/Compatible, the command is:

FORMAT B:/U/F:720
^
^
(Drive Letter, eg. for Drive B)

at the DOS prompt.

I don't remember the command format of ARC.TTP to extract an ARCed file;
I always use an ARC Shell to do it for me. Maybe others can help?

Rob was compiling MiNT... ok, I know that Mint may not be the only thing
he compiles, but, with all the problems/additional work you get with cross
compiling, I'd rather wait for the ST to compile my stuff. As to c++, yes,
in that case, I'd say stay away from the ST.

1189. Re: RAM doubler for Atari?

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 18:40:59 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <2p3svr$rb@charm.magnus.acs.ohio-state.edu>
Source record: 188610

I was just reading something interesting; Not only does RamDoubler do all the things I previously stated, it *also* compresses data in memory... So, programs literally take up less ram than they indicate in addition to all other memory manipulation functions...

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"You know very well that it is thanks to (war) that you are here enjoying your wonderful daily life so full of pleasure, reward, love, joy, and excitement. Actually, I'll wager that it's rather more full of anxiety, problems, economic difficulties, quarrels and disappointments, but you're so attached to them I shan't be able to shake you loose. Love and joy are incredibly habit-forming; often a single exposure is enough to cause permanent addiction. But I have no doubt you steer clear as much as you can of anything so masterful."

Note that, as of this moment, the "Soft Windows" stuff is based on a 80286 emulator. The company that makes this emulator expects to come out with a 80386 emulator this year. There are quite a few 386-dependent Windows programs out there now -- these do NOT work properly under 80286 emulation, So, you might want to wait a bit.

1194. HELP! Need vt100 terminal program

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 20:27:44 UTC
From: jjmcwill@next5
Message-ID: <2p4380$com@mtu.edu>
Source record: 188615

I am looking for a vt100 terminal program for a standrd 1040ST.
Can someone please tell me if such a beast exists over there in the
umich archive? There doesn't seem to be a descriptive index... and
I can view zooed and arced files without downloading them.

Many thanks.

Jeff

Likewise, I am encumbered by a number of ST User, ST World, ST Format,
and ST Review mags all with coverdiscs (dates of issue, 1990 thru 1993).

Email me if you are interested.

That's nothing. At the private (Christian) school where I went to in 6th grade, a bus driver worked there named (I swear in the name of Doom that I lie not) Dick Leech. Some of the torture he got from the Bible-toting hypocrite students was rather unchristian, as you can imagine. =-]

And when he said "the speed of an Intel 486", he means a 486-SX/25.
SoftWindows very definitely doesn't get the speed of a 486-DX2/66.
Of course, in native mode, the PPC is blindingly fast, and faster
versions are right around the corner. <drool>

>that is what we want..? PC-technology..?? Why did we buy an Atari, if all we
>want is a PC? Sounds quite gloomy - frighteningly desperate.

I have had my Falcon accelerated to 32MHz. It's now 25% faster. The cost
was 60ukp. The Falcon is slow, but it's still a great machine. It's a
shame Atari didn't follow it up with an 040 true 32-bit machine.

>So, why I'm getting tired..? Because - honestly said - the atmosphere here, in
>the Atari-areas, is DEPRESSING... Nobody believes in anything, nobody has

>You understand, what I mean.

Well I'm not. I'm very optimistic and I am now working on a Voice Mail
system for the Falcon. This will be available from HiSoft in a few months.

Memory management of TOS/GEM programs is much better than on the Mac where
a lot of RAM is never used. The benefits of such a system on the ST will
be _much_ smaller.

At last Peter a useful comment. I have an Apple CD300 connected to my
Falcon and it is a very nice piece of kit. I believe the drive you are
talking about is the replacement model for the CD300.

1204. Re: "Underground" ST(e) programs sought

Newsgroup: comp.sys.atari.st
Date: 1994-04-20 23:33:01 UTC
From: sebelt01@starbase.spd.louisville.edu
Message-ID: <2p4e3d$roa@hermes.louisville.edu>
Source record: 188624

My response:

Hmm, my news-link is not that reliable and it seems that I have lost many of the messages critisizing my requests for hacking and phreaking software for the ST(e). I'd like to clarify a few things:

1) I'm not looking for "pirate" software or anything like that; just programs that automate the brute force methods of hacking and phreaking, or generate tones the phone network recognizes. (If anyone has these types of programs, I'm still interested!)

2) Owning such programs is not against the law. Running such programs isn't always against the law. What IS against the law is defrauding the telephone company or illegally accessing private computer systems. Nowhwere have I endorsed the use of these types of programs for such uses.

To the (rather large) group of people that have responded to me in email: noone has sent me anything yet! As soon as I get something I will let you know...

If you want to use samples as instruments (transpose them and play many of
them at the same time), try "mjuzakk", a tracker-like GEM-software for
16-bit-samples. i.e.: ftp.uni-erlangen.de

>How about it programmers?

The POV system of using a text file to define a 3D space is VERY powerful.
Much more powerful than anything that could be represented visually.

There are POV visualizers for DOS. They aren't overly popular though.
There is just so much more expressibility in a text file.

So programmers are the least likely to help... unless they are into
Visual Programming (Ha! The dead-end of the '90s).

In <7480@merlin.ukc.ac.uk> nj1@ukc.ac.uk writes:

Some ideas:

Unless you have a multisync-monitor, don't even try "SUPER-78" program, or such that just change your 640x480 display from 60 to 78 hz... It's a good chance your SVGA will blow up.

Buy GENEVA, if you haven't got that yet. Much better multitasking than MultiTOS... GEMINI 2 looks like a nice desktop for Geneva, too. It's shareware.

Backwards should be 2.52 version, or newer. And don't forget these games:

MicroProse Formula One Grand Prix (I don't know, if MicroProse has changed this magnificent racing-game to be Falcon-compatible.. But older versions work too, with Backwards (16 MHz, Blitter 16 MHz, both caches off. During race one can turn the instruction cache ON (more speed..), and while saving one must turn the CPU-clock to 8 MHz. Simple, when one uses to it! GREAT game..!!!

Ishar 1-3 role-playing games (Silmarils). Glorious graphics, Falcon-only games. Get these, if you like Dungeon Master, and the like.

Also, get KOBOLD 2 fast file-mover, Diamond Edge hard-disk optimizer, and E-Copy copy program. They're all marvelous.

Papyrus and Script 3.5 are maybe the best word processors for Falcon right now. For image-processing, Chagall and DA's Layout are really worth looking. Calamus SL is perfect DTP-program for Falcon, although pretty expensive.

You should check these FTP-places filled with good, new Atari-stuff:

CNAM.CNAM.FR
FTP.UNI-KL.DE

That should solve the Gemview, Lasers & Men, etc. problems..!

> doubt barreling down as I type ;-)

Ok, here's one! :-)

-l means "loose line-endings"; with it, patch will ignore extra
whitespace (ex, spaces, <esc> characters, other crap) and differences in
the end-of-line character (ex, DOS/Atari use cr/lf, UNIX uses cr, Mac
uses lf; I might have Mac and UNIX backwards there).

Usually the problem is that your Atari patch is in Atari text format
instead of UNIX text format; without -l, even the end-of-line characters
will cause patch to fail.

Mech Warrior

I had a chance to play this a bit a few weekends ago, and thought it was pretty good; better than the BattleTech we had a few years ago for the Atari.

Wing Commander

This had great sound if you had an appropriate soundcard hooked to a stereo... I'm not a big fan of flight sims, but this was fun...

Ultima VII, Ultima VIII, Ultima Underworld, and of a zillion other excellent role-playing games released in the last year...

Does this mean you can do SLIP or something else over your serial lines
using the MiNT-net stuff? Like, could I grab Lynx (the text-only
World-Wide Web browser), compile it, like it with mint-net, install the
mint-net drivers, and do WWW stuff (assuming I had a SLIP connection
available)?

You forgot Atari, I can't understand why they never supported Atari but then
again there software probably never sold, but I here now a UK firm
has just brought the Software ToolWorks....

If I remember the UK firm I will post it here, may bewe should have a go at
this UK firm...???

Easy. VGA monitors have a limited bandwidth, pump too much into them (or too
little I think as well) as RGB and TV can cope with, and your monitor will go
fizz, pop, boom, smoke, spark.

Reasonable enough!?

Karl.

Ofir, just a quick note that I enjoy your reviews in Atari ST Review.
As long s Atari builds a computer there is hope, I am on close terms
with many people at Atari (I am the rep for Delphi) and although I was
hurt about the non-appearance of an 040 machine, the necessity of
making a bit of profit is unavoidable. Atari could not expect to keep
alive pushing the STe, no matter how great it is, and the money is not
there for the fight against the cheap clones. I firmly believe that
the Jaguar will result in a technological leap. Imagine a PCI card
based Jaguar graphics engine. Or maybe with the enormous flux the
computer industry will be in over the next few years, backing out of
the market to let the big boys fight it out and make the mistakes is smart.
There will be a dozen new operating systems fighting it out in a
little while. I think that Microsoft will be hard pressed with the
fact that they are coming out with several new OSs as well as the
PowerPC based IBM machines due out. A PowerPC based Atari? Maybe...
after the 100MHz PPC601s are out and the 604s come through. The price will
drop a bit and programs like the System 7.1 translator and Softwindows
will become more optimised for the chip. The market is going to be hell
for a manufacturer in the next year, but heaven for the user at the end.
All along I will be happy with my Atari TT030 (48MHz CaTTamaran included)
MegaSTe4, and Jaguar!

The comedian Spanky has campaign posters from some southern state (US)
of a politician named "DICK SWEAT". I think I would use richard.

We have one here in New Mexico, a politician that I have even met.
Believe it or not (on the good name of DOOM do i pledge - I think that
we should all pledge on something we really care about) his name was
DICK LIKKER. Another vote for Richard.

If my German is still working (be more careful next time Andreas, some of the anglophone community have a real complex about German domination of the Atari world), Andreas has one of the earliest Falcons. Recently ST Format gave a somewhat garbled report of a problem in the TOS of these birds for which Atari recommended a hardware fix.

To summarise Andreas' problem in English: in 256- and ``True''-colour modes he gets glitches when replaying samples or unpacking GIFs from his LPS240 SCSI drive. The resolution dependency suggests to me that this is something timing-critical (the Falcon runs a -lot- slower in these modes).

I'm still waiting for my SCSI disc to arrive, so I can't comment.

But that's silly. All it has to understand is that there's a partition
with partition type `HFS` (pr whatever), start sector x and length y. With
this information, it's trival to install a new GEMDOS filesystem without
affecting the other partitions. Other programs are clever enough :-)

1231. Excerpt from Game Developer magazine on Doom

Newsgroup: comp.sys.atari.st
Date: 1994-04-21 09:41:29 UTC
From: Gordie Meyer <biblinski@delphi.com>
Message-ID: <JC5t785.biblinski@delphi.com>
Source record: 188646

From an article entitled "The Making of Doom" in the premier issue of Game Developer magazine:

"...Although it has often been theorized that Id uses a lot of assembly language in its development, the main language used is ANSI C. 'Assembly language is almost dead,' declares (John) Carmack. 'Doom has only two assembler routines; one to vertically stretch a column and the other to horizontally texture-map a row. Everything else is in C.'

"If all of Doom was written in assembler and the programmer could manage the overhead correctly, Carmack theorizes it would only make the game 15% faster. And, although the main raycasting trace in Wolfenstein was written in assembly language, Carmack says he could write Wolfenstein faster in C because of today's better algorithm technology.

"Writing in ANSI C eases the strain of porting to other operating systems and recompiling the code on DOS, and NeXTStep helps clean out bugs during the development process. Carmack feels he could get Doom up and running in a window on a Macintosh over a weekend, but Id won't write the port itself. Id is willing to work with advocates of various operating systems, and talk of Macintosh, OS/2, and UNIX versions of Doom were discussed as possibilities."

I find this comment a little disturbing David since you sold me your
copy of Calligrapher Gold V.3 about a month before Calligrapher was
on that cover disk. You knew I wanted it for my Falcon too. Hmmm..
I was annoyed that Timeworks coverdisk version didn't work too.

Luckily the one you sold me does work but only with SpeedoGDOS disabled
and in a 2 colour screen mode. I've never had any problems with the
postscript driver yet either (which you were saying you had to hack
around!) I admit it produces Postscript files that are absolutely
enormous and I feel like hacking it myself too but only when I have
the time. I've not tried the coverdisk version (which I was reluctant
to buy and asked the shopkeeper if they would sell me the magazine
cheaper without the disk so I can't comment about that.

The thing that really annoys me is its use of non-standard
fonts. Now that it is on a cover disk someone might spend that time
that I haven't got in writing a converter for Speedo fonts into
Calligrapher fonts. What is the price of fonts generally these days
anyway. The price ST review quotes seems very high for a few fonts.

BTW. I noticed that on my version your name pops up on the info. dialogue
box. Did Working Title do that at some point when you registrated
your version?

Hi,

Is there someone here who knows something about ExtenDOS. I think it's being made by a canadian company and I would like some info about it. Like a TXT-file or preferably a demo version.

The program should make it easy for you to hook a CDROM drive to your system and then using it without MultiTOS. The tested CD-ROM drive is a tripple speed and both MultiTOS and MetaDOs have a problem setting the speed. Also if a file is bigger then 24Kb and you copy it to the HD the the copied file is corupted. ExtenDOS should be able to deal with this..

Thanx.. ronald

I am pro. And espacially the . mint version, cause now I'll have to skip them everytime i see m.i.n.t. at that particular order. With Atari on the rise again, why not even things up here on the net?

Joost.

Hmm, there should be a 0index file or something in each directory
plus a main one at the top of the atari directory. Anyways, look in
the atari/Telecomm directory:

Uniterm 2.0e, CoNnect 2.46, Storm (?), and a bunch of others...

I do believe it's one of the "seven signs of the apocalypse" when
Peter actually benefits this group, but I'll have to agree, he
made a good point (well done, Peter!). Mac Warehouse (and it's
"sister"(?) company Micro Warehouse) do seem to have a decent
amount of things Atari folks can use. I know I bought my
Linelink 144e modem from them, and it's worked quite nicely
(sure love the cps rate :-)

I even got a Mac weather-forecasting program free with the
modem (I believe that's what the software does). Gonna have to
fire it up under Spectre and see what it's all about...

Now if only someone would write a MAC.XFS so that I could access
my Spectre partition as I do my TOS and Minix ones... :-)

There's a program out on the net somewhere called vttest (or vt_test)
that, when compiled (it's source-released) will basically give
your terminal program a nice stress test. "Archie" should be
able to find it quite easily...

>Hi,
>
>Is there someone here who knows something about ExtenDOS. I think it's
>being made by a canadian company and I would like some info about it. Like
>a TXT-file or preferably a demo version.

Well, here's the text from the edos_v11.txt file found on GEnie
(basically a "press release"). BTW I haven't tried it out, am just
passing along the information...

----------cut here---

ExtenDOS v1.1 Now Available

The latest release of ExtenDOS, version 1.1, is now available from:

Anodyne Software
6 Cobbler Court
Ottawa
Ontario K1V 0B8
Canada.

ExtenDOS is a low-cost extension to the standard Atari operating system
that provides support for reading CD-ROMs in ISO9660 format (the industry-
standard). Version 1.1 provides new features, including full Falcon030
support, and limited MultiTOS support. It continues to offer higher
performance and more features than alternative solutions.

FALCON030 support
ExtenDOS now supports the Falcon030 in addition to the ST, STe, Mega,
and TT030. ExtenDOS has also been tested on the NEC 74 drive (the
external version of the NEC 84), and works without problems. The
list of drives that ExtenDOS is known to work with is:
Atari CDAR-504
Panasonic (Matsushita) CR-501
NEC 74/84
Sony CDU-541
Toshiba 3401
It is also expected to work with any SCSI-1 or SCSI-2 compatible
drive.

MultiTOS experience
Although ExtenDOS is not designed to run under MultiTOS, it will in
fact run, as long as memory protection is turned off. At this time,
the only drawback to running ExtenDOS under MultiTOS is that it is

impossible to run programs directly from a CD-ROM.

Performance
Initial timing comparisons show TOS+ExtenDOS to be 2 to 3 times faster than MultiTOS+XFS driver. Running ExtenDOS with MultiTOS provided performance somewhat slower than with TOS, although still significantly faster than the MultiTOS/XFS combination. These results were obtained with one MultiTOS setup; variations in setup may affect the relative performance.

Pricing
ExtenDOS v1.1 is still only $19.95 _including_ shipping & handling (US$ for US delivery, Cdn$ for Canadian delivery, Ontario residents please add 8% PST). Please make your payment by cheque or money order

1249. Talking Clock

Newsgroup: comp.sys.atari.st
Date: 1994-04-21 13:07:34 UTC
From: nj1@ukc.ac.uk
Message-ID: <7502@merlin.ukc.ac.uk>
Source record: 188761

Just a few quick questions -

Can Talking Clock be run in the background somehow without MultiTos??

And also, I have seen on some screen grabs in magazines a clock in the top right hand corner of the screen (in the menu bar)... What program does this and where can I get it from??

Is System Audio Manager available for FTP anywhere??

Thanks,

Neil.

That's true...

>Good computers SELL this one did not sell at all, facts not fiction....
That's not true (why did they sell C64 in the first place [because all
my budies had one]) . That is not going to happen to Falcon *snif*

>I can get a TOP 486 with all bells etc for 1/2 the price than a basic Falcon
>cost here, plus I get all the software and support I need..
Thats right.

>No ! no one can kid me that the Falcon is the way to go, unless you are
>mental..
Thats no argument.

I would buy an Falcon if it would be a) cheaper b) had 32 bit mem accs.

Now I just have to watch and then decide if things go well in ATARI front
after Jaguar had REALLY hitted the streets...

Message-ID: <1994Apr21.134120.6017@jet.uk>
Source record: 188763

Atari ST Review has a pretty good offer on Calamus SL this month, 199 quid.
(Although DMC are selling it in North America for 200 USD at the moment).
Perhaps the software people are finally realising that Pro level prices are
no longer appropriate for most Atari software.

And, even though I haven't seen this advertised anywhere, HiSoft are doing
a good deal on Atari Works for Falcon owners; I got it for 50 quid.

Disclaimer: This is not an ad; it's just for info. I have no connection with
ST Review, JCA, DMC or HiSoft.

Mail me at the address BELOW and I'll send you a file that gives time/date and
drive activity as a uuencoded file. It's called ledpanel and is very good. it
was on a recent ST Review cover disk.

1253. For Sale (UK): PageStream v2.2b, with free PageAssistant and fonts

Newsgroup: comp.sys.atari.st
Date: 1994-04-21 13:48:06 UTC
From: djs@jet.uk
Message-ID: <1994Apr21.134806.6116@jet.uk>
Source record: 188765
Cross-posted to: comp.sys.atari.st,uk.forsale

Due to upgrade to Calamus SL, I no longer have a need for PageStream.
It runs on the ST, TT or Falcon, including 256 colour modes. Version is
2.2b, which adds a DeskJet 550c driver to the 2.2 release, along with
a better PostScript driver. It's a UK version (ie British English
dictionaries etc).

Includes all manuals, master disks, numerous extra font disks and
PageAssistant (on-line help). Yours for 60 quid, including postage etc
within UK.

>
> Yet another defficiency in the Falcon OS.

This little Falcon 'problem' is becoming stranger and stranger as more research is being done. It seems that some Falcon's DO perform a screendump just fine, even in ST Low resolution compatability mode, while some others do not. The oddest thing is that it appears NOT to be tied to the TOS version. And it's not due to ACC or AUTO program conflicts either. Odd.

Source record: 188767

>
> Get the bad guy on screen, press pause (escape) and then click on him!
>
> Away you go!
>
> Andreas@AEO

Unfortunately that is not what I was looking for. I was interested in fly-by-wire recommendations since this is the most difficult method of combat, recommended maneuvers for the assortment of enemy ships types.

So far no one has provided anything. I have since come up with some but I'm sure there are more:

Options:
Joystick control.
Elite flight control method.
Target tunnels for enemy ships.
External view NOT fixed to the ship.

Control surfaces in use:
Joystick for fly-by-wire.
Mouse for icon functions.

"Lets play chicken" attack:
(Easy targets especially with 5MW laser or better.)

1) Target the ship. (I do this without pausing for that real time life & death simulated feeling. Its not that hard.)

2) Click on autopilot and wait for ship to line up in sights.

3) At 8 km an under start blasting.

4) Be prepared to disenage autopilot and veer off.

5) If a second pass is required move off by 12-20 km depending on enemy ship type and enage autopilot.

6) Repeat until someone dies.

Missile attack:
(Fast difficult ships to kill.)

1) Target and arm missile.

2) Ideal distance to fire is about 3-4 km when playing chicken. Or if they fly past, realign your facing on them, and fire immediately. The realignment of facing will reduce the need

for the missile to turn around.

"Keep'em busy" attack:
(Fast difficult ships to kill.)

1) Target and arm missile.

2) Fire missile as above.

3) Chase you target as it runs away from the missle using autopilot.
You may have to have to disengage the autopilot once its lined
you up and accelerate in order to keep the target in weapon range.

"Fly-by-wire" attack:
(Not very successful with pulse lasers, not yet attempted with
beam laser, though I suspect more success since you can then cut
across their path with a likely hood of a hit.)

1) Reduce or increase thrust along your flight vector.

2) Get to about 130km distance from target.

3) With engines off, fly-by-wire to line up the target. The target
will close in and become harder to keep lined up.

4) At 7-8 km start blasting.

5) Be prepared to engage the engines and veer off.

6) Repeat until someone dies.

For almost all "autopilot" attacks and targeting I keep the joystick in
one hand and the mouse in the other, normally with the pointer over the
Engine icon (F7).

To date I haven't had any success with using the mouse or keyboard in
either Elite flight control method (u/d/rotate or u/d/l/r).

I still haven't accumaluted enough cash to upgrade my ship to something
with more cargo capacity, missle, or gun mounts. Nor have I tried using
proximity mines for anything yet.

Always buy the best missile possible since there is nothing more annoying
than ECM equipment be used against you.

Eh? You mean if it's already loaded, it won't read and you have to eject and reload for it to be recognised again? Odd
Once a CD-ROM is loaded, it should behave just like a readonly hard drive.

1262. Mint mailing list

Newsgroup: comp.sys.atari.st
Date: 1994-04-21 14:30:48 UTC
From: donaldp@scowpat
Message-ID: <1994Apr21.143048.15657@sco.com>
Source record: 188773

I remember reading a while ago that there is a mint mailing
list if you wish to be a beta tester of the latest version.
Can someone tell me who I mail to join the list. I am very
interested in the mintnet work going on at the moment, and
would like to contribute.

Thanks,
Donald

Well, it's up to you but I have never regretted buying my Falcon, great graphics & sound, great software, great compatability. I've just added a 32Mhz accelerator and 68882. Sure, you get a lot more for your money if you buy a PC but I have a big investment in Atari and the Falcon has given it all a whole new lease of life. I'llprobably buy a PC too for the CDROMs and to put Unix on but I'll still have the Falcon as my main machine.

Hi all,

Has anyone got Enhanced Gem to compile using Lattice C? If so, could they E-mail me? I've been having problems getting it to compile..

And while I'm on the subject, is there any decent documentation (in english) for E-Gem?

THANKS (please reply via E-mail if possible)

Jonathan

Neil.. to answer your question regarding bar clocks, I use Bermuda
Clock. Like all the others I've tried it isn't perfect.

Over here in Windows land, however I use a shareware program called
BarClock that does about everything I've always wanted a barclock
program to do. Mac people have it good, too. I've tried to convince
the author of BarClock to port his code over to the ST, but he's not
much interested in doing this at all. Maybe someone else can convince
him.

Someone else may know some other bar clock programs for the ST that I
haven't considered.

No one accused you of being a pirate. I stated that hackers/phreakers and
pirates are both interested in using their computers for criminal activity
(theft). In my experience, I've found that hackers/phreakers are frequently
pirates, as well. If you don't like the association, find a new hobby.

Yeh, right. Let's face it... if you ever DID have a legitimate use in mind
for this stuff, you should have said so up front in your message.

What did NOT help your case was a couple of other messages that an individual
posted in your 'support' with intentional (and childish) illegal undertones.

Yup, and I'm 99% certain I'll be taking up that offer - I've been using 1.09n up til now!

A happy Calamus user! (and soon to be ecstatic SL user!)

I wonder how many people will be taking up the offer? It seems that DMC are really trying to
crack down on pirate copies of SL - DMC's big chesse said that in North America pirate copies
of SL outnumbered the real thing by 10:1 ! So by slashing the prices (for a limited time only) will (maybe) give more impetus to own the real thing + manual.

DMC even offered the upgrade to people with pirate copies (how much more generous can you get?).
A big round of thanx to DMC.

=======================================
I called a peripherals supplier today to ask about floppy drives for
STs, and he said they're not standard 1.4M-style drives. I thought
they were - anyone know for a fact? I know the older drives were
=======================================

Bullshit! He's either lying or incompetent. For the 1040STe and lower
you'll need a drive that can output density select (most can) so that you
will automatically be switched into the proper mode by the disk sensor
(you need 1 IC to do the clock swapping - without the density select output
you have to use a manual toggle switch). The MegaSTE and TT and Falcon
all contain switching circuitry built in, so the computer tries to read the
disk one way and if it fails it switches modes - you can format disks either
way - even without the disk hole for 1.44 (a manual toggle will do the same).

There is nothing special about the drives that ATARI uses. Although ATARIs
upgrade kit that uses the cheap Epson drives does NOT support density
selection output so do NOT get that kit (its overpriced anyway - I got my
1.44MB drive for under $50 US).

: >What is Devpac DSP? Is it available now? In the US?

: Devpac DSP is a 56001 assembler/debugger/monitor program, similar to
: Hisoft's other Devpac products. It is out now over here (UK), I don't
: know about the other side of the pond. It's worth getting if you want to get
: into DSP programming, and has a quite nice programming tutorial showing
: you how to write a DSP subroutine for matrix multiplication. I found that
: the demo files on disk were a bit wrong, but they're easy to get going.

It's a nice product, but the first version contains awful bugs...
Some examples ? jmi xxx are coded jnr xxx ! I had to
make a rout who automatically detects jnr and transform them into jmi at
the begining of the excution.... Of course, I could have tried some
dc xxxx to code directly jmi, but if you want to code the offset of
the jump as a short one, you have to add the opcode with the offset.
But, other bug, 16bits+24bits=16 bits for Devpack DSP, that's mean, since
labels are 16bits-long and opcodes 24bits-long, that your dc xxxx won't be
correct (MSB to 0).......

A question about your report on the following:

GEMBENCH 3.30 (C) Ofir Gal
Tests w/ and wo/ PAK3-020/16MHz
Reference: ST 1040, no blitter.

Is this a new PAK thing? I've heard about the PAK before, but now I've been outside of Germany for about two years, and I don't know about current developments.

I guess my question is, are there any affordable <$300 (<$500 DM) '020 or '030 accelerator boars for the Mega ST's?

Thanks for your help,

Bert :)

I tried ExtenDOS v1.1 on my Falcon with a Texel 5024 scsi-2 drive.
Worked like a champ (I wasn't under MultiTOS). Setup is as according
to the manual. Drop in your Gemini CD-ROM and go. Really great to
double click on P and there's the directory.

I also fired up up PhotoShow Pro 2.2 and tried out a Kodak-CD. I just
let the Photoshow cycle through the pictures on the disk. Great - it
worked also.

So at this point I think we are now plug and play - except for the interactive CDs and the ones that have code for other platforms. Speed seemed real good but I haven't tried getting any performance figures to confirm my feelings. (It was so nice to see it work on the Falcon - I have tried several other drivers but to no avail on the Falcon. Worked like a champ on my Mega under Mint with the Mint driver.

I got ExtenDOS and PhotoShow Pro from Greg Kopchak, 2233 Keeven Lane, Florissant, MO 63031 (tel(314) 831-9482.) He also carries the "It's All Relative" Genealogy software. Wayne

>[other depressing details deleted]

God, they're not still doing that are they? I assumed that since the falcon had more screen modes and allowed overscan they would ditch the CRETINOUS architecture of the STs video chips. But no. Surely doing one byte per pixel in a 256 color mode (as well as being faster to manipulate in software) is far easier and faster to do in hardware aswell? Oh well, if that's what you get if you want a cheap computer...

>If you want to play Doom on an Atari, buy a Jaguar.

Can't even afford a Falcon yet. Seems the only way to get decent power is to save up my k's and one day get a SPARCstation.

Dreaming on,
John.

Hi ATARIST-Freaks!,

I don't know if you are interesting about this, but there is a
MSX1 emulator for ATARI ST. I don't have the files here, but
If you want it, send an e-mail to Wiebe Weikamp
(wiebe@stack.urc.tue.nl).

Enjoy yourself!!!

As far as I know GEMINI does not work properly with GENEVA. Possibly there has been an update, but you should check before counting on being able to use it as your desktop environment with GENEVA...

Silent Service I bad?

I loved it.... the only reason that I don't play it any more is that my version crashed and i do have a lynx (no jaguar.... yet.....)

but i REALLY enjoyed it..... (sinking a 10000 Ton troop carrier yeah!)

Uri Shimron

P.S. it also works on monochrome (if only more games worked on a monochrome monitor......)

Wonderful! Quicktime with sound support? Also working on VDI Graphics
Boards? I know that the newer version had fixed a few 256 and 32k color
problems on 3rd Party Boards :-), can't wait to see it.

Maybe you are also interested in incorporating flx, the 15/16bit variant
of flc.. :-)

>How do we get such a group made?
>
>

You should ask that question in newusers actually. Right now there will be
a Count for Votes for comp.sys.atari.announce pretty soon, you basically
need to create an RFD (request for discussion) and once it appears as if
there are enough people interested....tou then make a call for votes (CFV)
which is done by a neutral third party...

If enough people vote i.e. over 100 vote yes, and less than one third
i.e. 33 vote No..then you have the group...but if it's more than a third
people who vote No and/or less than 100 overall Yes votes...then the
group fails...

The whole process takes about 2 months...and it takes a little longer afterwards to get the new newsgroups honoured at most sites..

I'm currently lobbying for comp.sys.atari.announce, and though I have had only
positive responses..I am not sure if there will be enough for 100 votes...

Cheers

Yat

Yeah, I hated Silent Service I for many reasons. First, it was a crudely assembled port of the Atari 8bit version. The graphics were by and large converted right over from the 8bit! Second, it was slow and had rather spartan sound effects. The game itself is gold but the implementation stinks.

I saw the Amiga version of SS I and it was far better...sad to say!

Before I go I'll add some more to the list of the good...

Barbarian
Overlander
Deluxe Asteroids
Midi Maze I

and the bad...

>was on a recent ST Review cover disk.

I agree - LEDPANEL is quite a nice item to have. I've found the
drive access display particularly useful when compiling things like
MiNT - i.e. you know where all the disk access is occurring, and the
fact that it *is* occurring - kinda gives ya that "warm fuzzy feeling"
ya know? :-) Between Ledpanel, and the FUJIDESK (that fuji symbol
spinning on the top left of my screen) I can tell whether the computer
is actually compiling/doing something, or whether it crashed/went to sleep...
(and someone once said the fuji was "useless" :-)

Ledpanel is reminiscent of TIMEDRV2, with the addition of the
ability to run in all standard ST modes, not just HI. Both are
good programs, nonetheless...

From: akarvone@cc.Helsinki.FI
Message-ID: <2p6t8o$8mm@plootu.Helsinki.FI>
Source record: 188656

I just bought a second-hand Atari 1040STE. I found a Mac-emulation program disk and now I would like to know how to transfer Mac-programs and files to Aladin-format.

I'm able to copy Mac-disks to PC-format and Atari can read PC-disks. The problem is that Aladin is not able to read Atari, PC or Mac-disks. When a disk is formatted under the emulation program one file is created on the disk. This file occupates whole capacity of the disk and all "mac" files and room for new files are "inside" this file.

How to move files on a PC/Atari disk "into" this file?

Um .... Roger, CoNnect DOES all of this. It even works on my NOVA
graphics card. That makes at least ONE software that does nice 16 color ANSI
graphics on the Falcon.

Did you finally trade in your ST for a Falcon? If so, I am happy for
you, and maybe now you'll gain some (more) appreciation for GEM-based programs
that have the tendency to NOT break across Atari architectures, unlike some TOS
based software. Don't get me wrong, TOS has (had) its place. I just hope that
eventually GEM (IE the AES, etc.) will mature enough to be a viable platform
for such applications as DOOM type projects (although, due to its high-overhead
nature, GEM may never reach such a level).

Regardless, happy computing. :)

Well, considering that the medium resolution of the ST/STE is 640x200 it
just barely will do. For games it should be ok ast they run mostly 320x200.
For serious work the 80 column text will be hard to read..

>How about the colour monitor supplied with an Amstrad CPC464??

Same thing, I once modified a CPC464 color monitor to be used with a
Commodore Amiga (pardon the expression..) worked OK, in the lower
resolution, that is: games only mode :-)

>Anyone know whether PC (VGA/SVGA/Multisynch) monitors can be used
>or adapted for use?

Nope, they use different frequencies. You can hook up a VGA black and white
monitor into the ST high res mode (640x400 70 Hz)

The older multisync monitors were capable of a horizontal frequency of 15
kHz (which is the frequency used in ST LOW and ST MED) and could also
handle ST-HIGH res, just needs a switch.(I ran an Eizo Flexscan for many
years on the 260ST, 520ST and also on the Mega STE4. Then came the TT :-)

The newer so called multisync VGA/SVGA monitors start at 30 kHz so they are
not usable...

Good luck,
Gert

HI all,
I was wondering if anyone in the Indianapolis area (5 hours or
so drive time away...) would be interested in swapping a stripped down
Falcon (no harddisk, no video, no ram...) for a complete T2200sx
notebook computer.
It has 4 mb ram installed (2mb PCMIA card) 80mb harddisk,
microsoft trackball, charger, carring case, internal modem (needs the
adapeter though..), and preloaded with a small Linux system (its never
has even SEEN msdos :)).
I am willing to make the drive to demostrate it works ok so no
risk on your part. It is a good second machine, its just i want another
atari, and just cant afford a new falcon right now...
If you want to talk, plesse E-mail me, i have a 3 day tiem out on
news and dont get on much, gotta work for a living :)...
Thanks....
Ziggy.

From: gt1448b@prism.gatech.edu
Message-ID: <2p79hm$kb2@acme.gatech.edu>
Source record: 188668

Well, if hacking is equivalent to pirating then many commercial Atari products are illegal. I serious doubt that Warp 9 was developed without any hacking of TOS. Or Spectre. Do you think Dave Small developed it without hacking at TOS and the Mac OS?

Outside the Atari world: Someone today told me about a fix for a bug in the MS-DOS 6.2 format command. Someone hacked it to find the fix. I suppose people who have DOS 6.,2 on their machine should either 1) not format disks or 2) revert to DOS 5.0 by this logic.

My theory for the contents of a new hierarchy including .programmers

comp.sys.atari.st
general questions involving program availability, for sale posts,
comparisons between software, general discussion
comp.sys.atari.tech
technical questions from the user's point of view. THis would include
compatability questions, hardware questions.
comp.sys.atari.programmers
any sort of programming question, from beginning level to advanced.

(excluding .announce and .advocacy, which don't need to be discussed)

I don't see that .programmers would override any of the existing groups. I
think it would be a good addition.

> you can get killed before you even start to move...

If it's the one I'm thinking of then you only need to try and cross near the bridge after throwing one or two grenades at the bridge to set off all the nasty mines etc. It might also be useful to fire a bazooka at the enemy guy with a very nasty bazooka-using attitude before he blows you up.

In the actual game this level is a total _git_. The enemy men pour like rabbits out of the huts and if you don't take the huts out at the start of the level then you are stuffed.

>
>Dreaming on,
>John.

Yes, they're still using the interleaved bit planes, and if you've ever done text drawing or sprite manipulation, you'd understand how much better it is than byte-per-pixel. Even most of VGA's modes have a bitplane for a page. Sure, drawing individual pixels is slower, but face it, that's not the majority of what is done. Do you like the performance of your Atari's text display, dialog drawing, and other things like that? The interleaved bitplanes are partly responsible for that speed.

If you have a byte per pixel and you want to draw a character, you're going to have to do quite a bit of work. Lets assume that your characters are 8x8, so they take up 8 bytes to describe a character. You have to pick the byte for each line apart, bit by bit, then using the bit value, decide whether to write the foreground color or the background color to the screen.

For interleaved bitplanes... for each line of the character, you need both the positive (the byte in the character table for the foreground color), and a negative (the byte in the character table xor $ff for the background color). You then take the color number of the foreground color and shift it one bit to the right. The carry bit then contains a flag that determines whether or not you put the positive into your accumulator. Next, shift the background color one to the right. The carry bit then contains a flag that determines whether or not you add the negative to the accumulator. You take the value of this accumulator and write it to the correct place in memory. You to this for each

successive bitplane.

I gave more detail for the second one because I have done it before. But you can see that for byte-per-pixel, you have to pick apart each bit from each line of the character. For interleaved, you need only pick apart the two color numbers and do a little addition before you write the data to memory.

Sprites are a bit more involved for both, but I think that although the interleaved-plane algorythm is harder to understand and implement, it gives you more freedom for certain effects and less for others. However, the structure of the data for a sprite could be stored in a way that matches the screen memory structure. For interleaved, you'd want to store seperated planes, while for byte-per-pixel, you'd store a list of colors and another list of flags.

[junk deleted]

There are several reasons for wanting to use a cross compiler:
1) For most sites, the compiler is already setup - you just need to make some
small modifications.

2) You don't have to download the many,many megabytes of compiler software.
This can really be a pain if you have an especially slow modem.

3) As you pointed out, time for compile is considerably less.

4) It doesn't require you to shell out big $$ if you don't have the resources
to use the GNU compiler - what if he doesn't have a 100+ MB disk (no you don't
need that big of a hard disk, but it does make it more comfortable), or 4MB
of memory (again, I hear you can do it in 2MB, however ...<shiver>).

5) It has a much better effort/KB ratio if you are just making small compiles.
MiNT when compiled is only 144k. That is maybe 15mins download time verses
the several hours of download, config, and compile time needed for doing it on
the ST side.

> by the way, my 8mhz mega compiled mint 1.08 in maybe 10, 15 minutes...

Yeah, right. I compiled MiNT 1.08 (with MTOS option) on a TT,
everything running in FastRAM, all compiler files copied to a ramdisk, and
only the source code was on the hard disk (15ms avg acces, 1.2MB throughput)
and it took me ~25mins to compile it. I very much doubt it took you only 10
or 15mins on a stock 8MHz ST, unless not including -030ONLY, -MTOS, and -O2
makes that big of a difference (with time like that, I gave you the benefit of
the doubt and figured you must have tured off optimization).

> --Bart

If you did manage to compile it in that time, I am very interested in
what you did to do so - I figure it would then take about 2.5-5 mins for my

machine to do the same compile. :)

Message-ID: <1994Apr22.004503.17599@wmichgw>
Source record: 188676

Problem #1:

I have the ZIP and ZOO deArchers and cannot dearc a single thing!
What are the commands to extract a file with these two archivers? I have been
able to use ARC602.TTP and LHARC.TTP without any problem. These other two
seem to defy logic to me! The ZIP package I downloaded and deARCed has at
least a dozen files with a 68000 and 68020 subdirectory. The readme docs are
not ligned up either. Someone, please help!!!

Thanks to everyone who helped me figure out how to get started with
all this in the first place! My Atari has never gotten so much use!

Brian Mc

1319. HELP! How can I copy Mastertracks Pro?

Newsgroup: comp.sys.atari.st
Date: 1994-04-22 05:49:58 UTC
From: mcwilliams@wmich.edu
Message-ID: <1994Apr22.004959.17600@wmichgw>
Source record: 188677

Problem #2)

I have Master Tracks Pro (sequencing program) and the company no longer supports the product. They have discontinued it. I have no backup copy of the program. I used DISKMECH on it to try and make a copy of it. Track 79 seems to be the sector used for copy protection. DISKMECH can't seem to duplicate this track. Does anyone have any suggestions as to how I can copy this? Can I also add that Passport are weazels! When I begged and pleaded to them to try to dig up an extra copy (come on, you spent years working and selling this product and no-one has a copy anywhere!!!) and they didn't think it was worth their time! Never mind that I payed $300 for this thing! I was told that for $150 they would sell me a Mac version. JERKS...

Brian Mc

1320. HELP! Recovering bad sequencer file

Newsgroup: comp.sys.atari.st
Date: 1994-04-22 05:54:06 UTC
From: mcwilliams@wmich.edu
Message-ID: <1994Apr22.005406.17601@wmichgw>
Source record: 188679

Problem #3)

Ok, last question. I have a file that I'm trying to recover without success. I'm using MEMFILE to track down the exact sector location of a file that was about 20,000 bytes and now is being treated as if it is 2048 bytes long. The file will not load into my sequencer. I was stupid and didn't save a backup copy and the effort that went into it is just too much to duplicate. It's funny that it stops at 2048 bytes - seems like the end of one sector and the start of another - so possibly the pointer to the next sector is screwed up. If anyone has any ideas, programs to try, techniques, anything! I'm game. I'll even copy my disk and send it to you!

That's it!

Thanks,

Brian Mc

> board is distributed in Europe?

Ok, I have found out a bit more about this board. First, it is being made
in England. The company already has an 8mb board out for MegaST computers.
The MegaSTE version is not yet available, though D&P feels it should be
ready within the next two months. It will add an additional 8mb to the
machine, for a potential of 12mb total.

D&P's FAX/tech info line is: 216-926-3842. I would presume English dealers
would know about this device as well (and be closer to you).

Hello everyone,

I'm the owner of a Protar Progate 40DC hard drive - 40 Mb which I thought would be sufficient space! (more the fool me!)

What I wanted to know was if it is possible to add another drive inside my case? I'm sure when I bought it I saw something claiming there was room inside for other drives.

I'm really needing more space so I hope someone can let me know if it's possible or even better of they have fitted an extra drive in such a model.

Thanks, and keep up the good work.

Barry

1329. Talking Clock (again!)

Newsgroup: comp.sys.atari.st
Date: 1994-04-22 10:22:44 UTC
From: nj1@ukc.ac.uk
Message-ID: <7510@merlin.ukc.ac.uk>
Source record: 188689

Many thanks to everybody who answered my questions!

Also, fiddling around with my Falcon last night, I found a way of getting Talking Clock to run all the time, whether using MTOS or not..... If you already know then sorry, but as there were no replies on this question....

Simply run TLKCLOCK.PRG as normal, and select the settings you prefer (e.g Every Fifteen Minutes / Close Window).. It seems as though these settings are saved within the program file itself. Then just rename TLKCLOCK.PRG to TLKCLOCK.ACC and copy it to the root, along with it's resource (don't know if this file is neccessary coming to think of it - something you all can try!) and hey presto! When you reboot, 'Talking Clock TM' is under the desk menu, and your Falcon will pipe up the time every 15 mins (or whatever you set it to) Selecting the item in the menu comes up with the clock in the window, but it's so ugly I don't bother!

Regarding the Menu Bar clock, Thanks for the responses! It seems like LED Panel is the most popular, so I'll give it a whirl tonight. I remembered where I saw the one I mentioned - it was in the HiSoft catalogue.. It was simple, smart and looked elegant... I think it could be part of Harlekin, as I remember something like this when I used Harlekin 1 from an ST User Cover Disk..

I am still yet to find System Audio Manager and/or Audio Fun Machine... If anybody can help me out with those I'll be grateful.

One or two other things... VIEWER.APP (The MTOS Text Viewer) doesn't seem to work - I get the menu bar, the information bar underneath that, and a bar underneath that which is part of the desktop (!) which doesn't go away.. Also on small docs it just doesn't seem to work at all!
How do get Paula to work with Before Dawn? There is an option under sound but it is always greyed out, even when I have PAULA.PRG in the directory... Does anybody know of a .MOD of the 'Jaws' theme - I think it would be quite nice to go with the Jaws module (where shark fins go across the screen)!!!

Thanks again for your replies to the first questions,

Neil.

Yes, it does (on Atari TT with NVDI 2.01).

: Also will it run from another drive than C:
Yes, but you have to set the paths right. To do this, press CTRL (or was it SHIFT)
when you start the program. Then you have to find the right menu.

: Does it support a Supa modem...
I`m not sure, but I think it does.

Ah, the age old confusion of defintions (i.e. arguing a point using
different meanings of the key issue). Hacking in the traditional
sense (a la Dave Small) is not illegal, it's basically messing around
and getting the computer to do what you want to do. Hacking in the
sense that the media likes to use is more of either "breaking in
to a secured area." Not to be confused with "cracking" which is
basically making a "work-around" from copy-protection, etc.

Folks, since the internet is such a conglomeration of people,
what say we find a new term for "hacking" to replace either
the traditional term or the media term. That way maybe
this confusion would go away?

>Outside the Atari world: Someone today told me about a fix for a bug
>in the MS-DOS 6.2 format command. Someone hacked it to find the fix.
>I suppose people who have DOS 6.,2 on their machine should either 1)
>not format disks or 2) revert to DOS 5.0 by this logic.

But think, with the lawsuit against Microsoft about DOS 6.x
(in particular, the DiskDoubler utility) it seems they may have
done a little, er, using "reusable code" that they shouldn't have? :-)

Personally, I like the "Bill the Cat" definition
of hacking: "ack accck phhhhhhhhhhtttt..." ;-)

I use STZIP which has a graphic front end so I've never had to worry about the
command line. try and get a copy of STZIP - it's superb.

As for zoo, try 'zoo -extract filename.zoo'

|> I'm game. I'll even copy my disk and send it to you!
Very nasty and quite probably unrecoverable. If the directory entry reckons it is
2048 then you've probably lost it, if the directory says 20,000 still then you'll
be luckier. You need a disk editor to find the missing sectors. If your lucky
then they will be in a continuous chain on the disk, if not, you'll have to find
them one by one and re-link. There are various PD editors that can help in this
respect. I don't have the docs here to check exact details.

Source record: 188696

Ok, good you got DISKMECH and you've isolated the program's protection scheme to track 79...

The question is:

What did DISKMECH display on screen when you did an analysis. DISKMECH has several features that let you analyize a disk track and print this information. Perhaps if you posted this information (be as specific as possible) someone on the net might be able to give you a hand.

Also, is Mastertracks Pro as Single or Double sided disk? DISKMECH can do copies of both sides...maybe you missed one?

Remember, DISKMECH isn't a cure all - however, it is free and can give you alot of insight into what kind of protection scheme is at work.

You can try obtaining a late version of the commercial copiers ACOPY or PROCOPY. These might do the trick - otherwise, try to find someone who has a SYNCRO-EXPRESS or BLITZ COPIER device. These are hardware devices that can copy most disks that ST software copiers can't.

Finally, it is possible that MasterTracks pro was copy protected on a MAC. This would make it extremely difficult to copy via software because of the hardware differences of our computers, etc.

BTW, there is another PD/Shareware disk copier available called Hack-n-Copy. This program can be found across the US in PD libraries. It is old (1987) but has lots of features...It is actually a new version of an even older commercial copier called A-Copier.

Also, I think that there's a German Copy program called CopyStar that is shareware and might be able to copy the program.

If you can't find Hack-n-Copy, I think I have a copy of it. Let me know and I'll send it to you, etc.

Hope this helps...

>given negative connotations with such things...

Of course, a "hacker" in the purest sense of the word does not connotate illegal activity. Anyone who likes to tear a program apart just to see how it works is a hacker and that's certainly not (necessarily) illegal.

Using a computer to gain unauthorized access to private and government systems, steal credit card numbers, and make 'free' long distance phone calls is a whole 'nother story and is what I was referring to, of course.

Cheers,

-Hutch- @ Fair Dinkum Tech

Read my posts(s) again, David, and you will see that I specifically used
the term "hacker/phreakers" to differentiate from the inherently innocent
"hacker" that many of us can identify with.

I'll take my hits when they are due, but not this one. ;-)

This is possible with the Protar Mark II. In the mean time, you could use
PFXPAK to pack all your PRG, TOS and TTPs. That should free up some space.
There is a GEM version. but the simplest one is the TTP version which
takes two parameters, the filename and the destination filename. Try it,
it's excellent!

yes, that an investment you have to make... but, if you really don't what to do that, make a trip to campus, go into a lab and ftp the stuff to a disk.. split the files if you have to... getting out might do you some good...

>3) As you pointed out, time for compile is considerably less.
>
>4) It doesn't require you to shell out big $$ if you don't have the resources

>_need_ that big of a hard disk, but it does make it more comfortable), or 4MB
>of memory (again, I hear you can do it in 2MB, however ...<shiver>).

hmm... most of the time, I don't work on large programs. Mint and a couple of other programs are exceptions... more likely, I'm sitting in my apartment and I suddenly get an idea. I boot the computer write something in maybe half an hour, compile it, then it takes a few more edit/compiles to get the bugs out, each time running the program, of course, etc...

now, to do this with a cross compiler, i'd have to call the net switch, (the lines may be busy)
telnet to my site, which sometimes doesn't work because the net is down, the name server is down or maybe even the machine... fight with other users for cpu time (our computing facilities aren't that great) watch my quota (it's

not small, but still, I have a few x programs compiled...) upload my program,
or edit it online, which is a pain, because even at 9600, it's not that fast...
compile it, maybe i could get the syntax errors fixed quickly, but we both
know that syntax errors aren't the problem... so, dowload the executable,
(disconnect?) ok... run it from a shell in a window.... great, it doesn't
work... back to online, etc, etc... while all this time my line is busy...
plus, i'd like to have a compiler on my _own_ machine and not depend on
anyone else's machines, especially with their authoritarian attitude...
sometimes, i write functions in assembly language and link them to my
C programs, ... hmm... I doubt you can do that easiy with a cross compiler.
well... let's not get into that...

>
>> by the way, my 8mhz mega compiled mint 1.08 in maybe 10, 15 minutes...

>
>-MikeB

hmm..... actually, I don't remember very well how long it took... I didn't
actually watch each of the source files being compiled... i remember i got
through maybe half of it and it broke because I didn't have yacc on my system,
so the next night or something like that, I downloaded bison and put it on
my system, then finished the compile... I don't know... yeah, it was probably
longer, but it's not like I had to do it more than once... just do it once and
forget it... well... I'm not Eric, so I don't need to compile it 100 times
a day to see if this change in the code fixed this bug, etc...

You may try micros.hensa.ac.uk

You may access us through ftp, telnet, WWW, gopher, mail-server, modem.

The Atari section has been bit out of date, but I am hoping to make it better.

For example, we already have a few new programs on our system: Gemar 2.20,
Master Browse 4.0, LHarc 3.0, STZip 2.5.

Best access so far are through gopher and WWW, however ftp is fine if you are not
too scared of cyberbrowsing and reading docs.

To start you off:

ftp micros.hensa.ac.uk

cd micros/atari

from here you have two options: cd tos or cd mint.

say you take tos. you then have another 2 options, cd m or cd n.

your best bet here would be to first download the index file, and browse at your leisure.
However, if you are looking for a particular file, then you may
do an archie search from your machine, and find out the full path nam,e for the program
here.

Gopher uses a different system, where you may search by type of program.

So come on, every one of you on the internet, log in from next week, when newer software
and the new machine will be on-line. Make the Atari section a success.

>Is it 4MB/s or 4MB/min ?
>Putting back 4MB/s to your disk would be very near the limits even of a TT (if
>you want them sortet in directories).

He's probably confusing the 4MB/s for the maximum transfer rate over
the SCSI bus. This would only happen if the data was in the Viper's
cache RAM. The actual data rate to/from tape is around 115K/s
(according to the Viper's Specs.) so this is the fastest rate you'll
'observe' when doing a backup or restore. Still amounts to about 6.5MB
per minute at full tilt (ie. lots of big files), which is plenty fast
for most people!

Cheers, Steve

Calligrapher works on a Falcon in monochrome (any resolution) mode. But,
that aside, STR doesn't sell to enough Falcon owners to make Falcon
compatibility a big issue.

What a rude, ill-educated, inaccurate person you are, Roger. Why don't you
buy your windows beast (you'll need a 486/66, BTW) and leave us to it?
There is *no* point, IMO, for this kind of pessimistic whining in a
support conference for *any* computer.

>seem to defy logic to me!

ZOO: zoo -extract filename.zoo

As for zip, it depends. If you have the Infozip unzip, then doing
a "unzip filename.zip" should work. Just get a copy of the latest
STZip (STZIP25.TOS, I believe, a "self-extracting" archive). It's
all GEM based, all point n click, and should be relatively
straightforward...

As a side note, if you want to use Pkzip on the PC to unzip ZIP files,
do "pkunzip -d filename.zip" (the "-d" is in case there are any
subdirectories in the archive - I guess the folks at pkware
didn't think that should be the default :-(

>The ZIP package I downloaded and deARCed has at
>least a dozen files with a 68000 and 68020 subdirectory. The readme docs are
>not ligned up either. Someone, please help!!!

See above about STZIP25.TOS (or STZIP24.TOS). Anyways, if things
are separated into 68000 and 68020 directories (for whatever reason)
then just use the executable from the 68000 (if you have a TT or Falcon,
then ya could use the 68020 version I believe)...

I have a couple of questions about Gemulator can you answer them for me. What is the highest speed it can emulate? Does it support st sound, hard drives. I have an STE will some of my programs work. How about midi, modem, printer, and other ports do they work? Do you have a list of software that you have tried and really works. Does it work on OS/2? What type of machine and slots can I use ie. 486 66/Mhz or Pentium? I am sorry I am asking these questions but I am really interested in buying this but I want to know if it works.

1358. laserdemo.tos.z /archivers

Newsgroup: comp.sys.atari.st
Date: 1994-04-22 18:09:38 UTC
From: steve@snark.cs.city.ac.uk
Message-ID: <2p93t2$a96@bambam.cs.city.ac.uk>
Source record: 188716

Has anyone got /Falcon/laserdemo.tos.z on AA (actually the mirror on
src.doc.ic.ac.uk) to unpack?
I tried uncompress (on a Sparc) but uncompress compained it was not a compress
file.
I tried gunzip (on a Sparc) which gave me a file 'laserdemo.tos'

Running this on my falcon it declares itself to be a self-extracting zip archive,
which runs for several minutes, listing file names, declaring them to be
corrupt and making empty files.

BTW is there a falcon compatible unzip? 'unzip' crashes on my falcon after
correctly extracting the files but declaring them to be corrupt (the're not!).
'gzip' & 'gzip-tos' (same program?) both refuse to handle archives with more
than one file!

Also which of the 9(!) lharc/lzh unpackers in /Archivers is current?
(arclzh63.lzh, decompre.lzh, lharc.arc, lha201.lzh, lha_232.tos, lha3.tos,
lzh201le.ttp, lzh_201l.lzh, unlzh172.lzh)

> Atari's own models are excellent but difficult to obtain. Also
> seen a cable that can run a VGA in Black & White Hi-res. Any
> advice out there?

Ok, here is my opinion. For color stuff, the best output I have seen
has bene on Multisync monitors. To use such on an ST, you need a special
switchbox. Such monitors can also be used for high res output, but I think
the Atari SM124 monitors provide better output. With a very high end
Multisync, the difference might be so slight as to be ignored.

So, if you want to go non-Multisync, I suggest getting an SC1435 (if you
can find one) for color stuff, and an SM124 for high res stuff. If you
go Multisync, you may still end up buying an SM124, but they are cheap.

Oh, the Atari VGA mono monitors I have seen were crap. I would personally
search for an older SM124.

1363. ANNOUNCE: ASTRAsoft StormTracker: The First GEM MOD Editor

Newsgroup: comp.sys.atari.st
Date: 1994-04-22 18:34:25 UTC
From: D.Oakley-SE1@cs.bham.ac.uk
Message-ID: <2p95bh$l9e@percy.cs.bham.ac.uk>
Source record: 188721

```
Announcing....
ASTRAsoft StormTracker
======================

for the Atari ST, STe, MSTe, TT and Falcon

StormTracker is a completely new type of MOD editor, a breath of fresh
air to people who have been long baffled by the peculiar Hex digits and
code found on ProTracker, Audio Sculpture and others.

Features include:

o Full GEM Support and use of windows

o Graphical view of notes and effects

o Playback using Yamaha, DMA 8, or DMA 16-bit output
depending on what's available

o Sample Editor

o Imports signed, unsigned and AVR samples

o Full ProTracker sound support

StormTracker will be a commercial package, priced UKP 24.95 from
Goodman International PDL based in Stoke on Trent, England, available
late-May 1994.

A demo is available from atari.archive.umich.edu in folder
Sounds/Players/stracker.zip and also from ftp.tu-clausthal.de

Comments and suggestions are welcome, as are people willing to use
a limited-length use version of the full StormTracker to write tunes for
the commercial release

All email to: dxo@cs.bham.ac.uk

Thanks,

David

Hi *!

HBJ>I'm just glad that (hopefully) we shall be able to buy such an
HBJ>excellent product, and I'm willing to wait as long as it takes (well,
HBJ>maybe not TOO long!).

Sorry guys, don't be _too_ enthusiastic about this 28/36 mhz accelerator.
It's still a 68000 working on that board.

The non-E-version ist out in Germany for quite some time and there are a
lot of problems.

To get it started you have to do a cpuple of things i. e. replace pull-ups,
some TTL's and if you're lucky the board _might_ work. If you have any IMP
components in your machine, it's almost shure you have to replace 'em.

Not to mention the problems you will encounter when using a graphics-card.

In the MausNet we have an on-going discussion about this accelerator.

IMHO buy a PAK 68/3. That works with any 68020/30 and copro with up to 60 mhz!
(Even higher, and there is a FASTRAM-adaptor coming soon). Don't know the
international price for it, but having in mind it's performance, it is _much_
better value than a 68000 running at 28/36 mhz.

[Posted on 22 Apr 1994 21:39:01 GMT]

hi guys, first of all, this is in the USA!!! :)

I'm looking for two storage cards for an Atari Portfolio,
and I mean AS SOON AS POSSIBLE!!!

I tried looking into every bookstore I could looking for
Atari magazines (in Boston) but with no success (so that
I could look up vendor addresses/phone #'s).

So I need either:

- for you to sell me 1 or 2 storage cards
- to tell me where in New York or boston
i could find atari equipment
- or some phone numbers of companies that
could provide me with these cards.

Thanks for your time atarians!!!

Unless you have a stock 1040ST with a color monitor; then UniTerm
is better because (1) the font is actually legible, (2) it uses less
memory, and (3) doesn't need GDOS.

Just an opinion, of course; try them yourself...

>would like to know, how hard is it to put another HD in to the ICD
>Case? There is plenty of room in the case. I don't know if I should
>get a completely new drive or add one to the one I have.

Somewhere in the case should be a 50Way SCSI ribbon cable. One end of this will go into the drive. The other end into a host adaptor. This is either a circuit board inside the case (as in an ADSCSI+) or an external box (as in the LINK). To add another drive, all you need to do is replace the ribbon cable with a longer one with an extra 50way IDC(?) plug just like the one which already plugs into your existing drive.

Then just plug in the other drive and set its SCSI id.

The only thing to watch is that your PSU is big enough to cope with both drives - especially if they are to power up together.

>Speaking of Hard Drives, can I use (shudder) one from Big Blue? If so
>can you advise as to what type to get.

Its got to be some sort of SCSI drive, and it really needs to be able to have its parity disabled as the LINK doesn't like parity.

Other than that you can mix and match makes and sizes of SCSI drives (and other devices) with a bit of luck. Obviously not all combinations will work, but IMHO 99.999%(ish) can be made to work in the end.

Roland.

You should be able to add another drive - no problem.

Alternatively just dump the 40Mb mechanism and fit something a bit bigger.
The is what I did to my Third Coast "Monster". It now has a whisper quiet,
super fast 240Mb drive - and it works like a dream.

:-)

Roland.

1382. SCSI connection

Newsgroup: comp.sys.atari.st
Date: 1994-04-22 23:57:56 UTC
From: wa95008@black.ox.ac.uk
Message-ID: <1994Apr22.235756.4676@black.ox.ac.uk>
Source record: 188736

I know the Atari ST is not brilliant for its universally standard ports,
but is there any way of connecting a SCSI hard disk (eg from a PC) to an
ST. I know there are commercial products like the Link, but does anyone
know how to overcome the slight incompatibilities?

I have an Atari STFM, and not having decent storage facilities is annoying
me slightly (so much so, that I'm considering buying a PC - aargghhhh!! 8*>)

On the subject of storage space - how difficult is it to upgrade the internal
800k floppy disk drive to a 1.44Mb one. I understand that the floppy disk
controller chip will need to be changed - Is this difficult? More importantly
is it expensive?

Thanx in advance..

Use lha3 or lha 3.01.. as for ZIP, use the newest version of STZIP (not sure
what the version number is offhand), unless you are using some kind of
other weird zip algorithm, you shouldn't have a problem.

>> --

While i didn't see this original reply from griff, the falcon is no
where near the 486-25 when doing doomish stuff.

>I tend to agree with Griff. Allthough my credits are still to be founded,
>I've been working on a game for the Falcon in 256 colour mode. Moving a
>32*16 sprite over the screen seems to go pretty fast when done by the CPU,
>even with 8 words need to change a pixel. My program doesn't want to change
>1 pixel at the time: it changes 16 pixel's at the time, which takes about
^^^^^^^^
Ah, but doom uses 1 pixel VERTICAL strips. and its takes ONE BYTE per
pixel.

Heck, if the falcon had a 1 byte/pixel chunky mode then I could see
a small screen version of doom. but the 2 byte/pixel mode is to slow
and sucks up tons of bus bandwith just for screen refresh.

>the same amount of time as one pixel. A lot can be done by software. I
>thought especially Atari developpers we're cunning in doing great things
>with software, where other platforms had hardware (and costed more $$$).

of course a lot can be done by software, Doom is all software.

: >I have had my Falcon accelerated to 32MHz. It's now 25% faster. The cost
: >was 60ukp. The Falcon is slow, but it's still a great machine. It's a
: >shame Atari didn't follow it up with an 040 true 32-bit machine.

: Is this done by 'upgrading' the clock speed only ?

I guess not.

You don't need a 60 Pounds-package to double the Falcon's CPU speed.

Simple TTL will do the job for about 60 pence.

1402. Falcon and STe Joysticks?

Newsgroup: comp.sys.atari.st
Date: 1994-04-23 09:22:45 UTC
From: ap748@cleveland.Freenet.Edu
Message-ID: <2papd5$r3k@usenet.INS.CWRU.Edu>
Source record: 188750

What type of joystick port does the Falcon or STe have?
Reason I ask is that the Jaguar controller box says that the Jag controller
fits these computers as well. My ST has the old standard 9 pin joystick
plug. The ST has a Female plug while the Jag has a Male plug.

Date: 1994-04-23 10:02:35 UTC
From: chioua@topaz.ucq.edu.au
Message-ID: <1994Apr23.200235.1@topaz>
Source record: 188551

Hello there,

Am I glad to have found you guys. Many years ago I owned (still am) an Atari 520ST. Yes, the original 520ST - the one with the 360K external drive. I still have that machine and still in working order. I ran a national user group of close to 500 users. But that was about 6 years ago.

Unfortunately, due to overseas studies blah blah blah etc, I had to stop using the ST for awhile (6 years!!!). But I still affectionately like the ST. I wish to follow up with the latest development on the ST. I have tried reading up on the other postings, but I can't make much of what is going on. Can someone please fill in the blanks for the last couple of years.

Is Jack Tramiel around? Is the ST still the Numero Uno in Europe and the UK? Has Atari finally came up with the UNIX, PC and ST all-in-one box compatible machine? What happened for the last six years? Does anyone still use first word plus? Do you still have the cherry bombs on the screen when the ST goes into limbo? Questions of questions -- is the Atari ST finally downward(!!!!!!) compatible with the Amiga?

Thanks a billion.

Andrew.

1405. The 3-in-1 ST - Does it exists?

Newsgroup: comp.sys.atari.st
Date: 1994-04-23 10:20:53 UTC
From: chioua@topaz.ucq.edu.au
Message-ID: <1994Apr23.202053.1@topaz>
Source record: 188553

If I wish to get an ST with the following
configuration. Please tell me what must I
do:

1) UNIX compatible
2) MS-DOS (IBM PC) compatible
3) MAC compatible

I know all this is not impossible, because 'they'
have been talking about it many years ago. I was
there when Atari introduced the 3-in-1 computer. Running
the Magic-SAC and PC-Ditto on a 1Mbyte-68000 machine. Yeah
I know it may have been only a Mac-classic and PC-XT
compatible, but I guess things must have been upgraded by
now.

I need the above configuration above badly as I am doing quite
a huge project involving all the above platforms. Would it be
cheaper if I just get a top-of-the-range ST and add in all the
emulator packages OR just get one each of the above machines?

What now?

Thanks a billion. Andrew.

1406. GFA BASIC ST <--> GFA BASIC PC Windows

Newsgroup: comp.sys.atari.st
Date: 1994-04-23 10:27:58 UTC
From: chioua@topaz.ucq.edu.au
Message-ID: <1994Apr23.202758.1@topaz>
Source record: 188554

Is the GFA Basic for the ST compatible with the GFA Basic
for Windows under DOS? I need to know because I will be
doing a cross-platform project. GFA Basic is the closest link I can
get that is most 'tranportable' between a PC and ST.

Is there anything out there that can do the same with the ST and
MAC?

Thanks a billion.

Andrew.

>Apparently, no one is serious about developing Falcon or TT specific games...
>As I said, if there would be some money (not a fortune but decent) and not
>promises, I would be interested in doing the GFX for a fal game or two...

A number of people on here have already said that they're developing
Falcon games - and there are a fair few already available on various
sites.

I'm writing a pretty simple game at the moment (i've been out of
games/graphics programming for some time now so the first one's got to be
simple [g]). And am going to be very interested in the amount of shareware
registrations that it's going to generate (if any).

This, of course, is the crux of the matter - as most Falcon specific games
are going to be shareware - how many people will be willing to pay?

>developed it without hacking at TOS and the Mac OS?

Hey, what about MiNT? Do you think it could have been developed from purely 'legal' documented knowledge of TOS internals? And that's now official. Atari are in a way supporting the hacking of their own software. And following from a different post, I think most software licenses nowadays state that reverse-engineering, dissassembly, decompilation etc. of the code IS illegal.

> The Blitter is to slow, can some ome Please explain why did Atari bring
> out such a stupid machine....??

While I respect the opinions of the programmer in question here, I'd have to dissagree with him on this point. The Blitter is just as fast as the '030 for doing memory moves. What screws people up on this point when you are doing performance comparisons is that using the Blitter for moves means that the Blitter has to share the bus with the '030. On the other hand, using the '030 for the moves means that the '030 DOESN'T have to share the bus with the Blitter. Doing this kind of test is really unfair to the Blitter, because the '030 isn't operating under the same constraints as the Blitter is.

The real power of the Blitter comes from the fact that you can set the Blitter up to do a move and then let it take off and do the memory move WHILE THE '030 IS DOING SOMETHING ELSE. If you set the Blitter up and then wait for it to finish before doing something else, then yes, the '030 will be faster. This is the way people used to working with clones program. Most of them aren't used to the idea of a DMA device being able to do its own thing while they are using the CPU for something else.

}
} Is Jack Tramiel around? Is the ST still the Numero

Jack Tramiel let Atari to his sons, and they didn't expand the ST as it
should have been. That's why the ST is no more the first computer in Europe anymore.
The f**king PC is the king nowadays, how sad it may be.

} Uno in Europe and the UK? Has Atari finally came up
} with the UNIX, PC and ST all-in-one box compatible
} machine? What happened for the last six years?

No. One of the biggest mistake always repeated by the sons was to cons-
tantly and repeatedly announce new machines, and never release them. During the same
time, PC and compatibles increased in speed, power, sound, graphics, until the outpassed
the ST by miles, and for a continuously decreasing price...

} Does anyone still use first word plus? Do you still

Certainly. At least one person, I'm sure... :-)

} have the cherry bombs on the screen when the ST goes
} into limbo? Questions of questions -- is the Atari ST

Yes.

} finally downward(!!!!!!) compatible with the Amiga?

No.

}
} Thanks a billion.

Three years ago, Jack Tramiel decided to take Atari back, and planned a new
computer. It's out now, it's called the Falcon, has better abilities than the PC in many
domains, but is a bit underpowered, and some find it a bit outpriced compared to the PC.
I personnaly have got one, I find it very nice, enjoy it a lot, and find it a bit
underpowered.
I however doubt it will do the same score that the ST did, because it came a bit too late,
and Atari doesn't support it a lot, being too busy with their new game console, the Jaguar.
It's too bad good machines don't get the support they should (I'm thinking about the NeXT
too, for example).

}
} Andrew.

I'm sorry to disappoint you. However, there are still very active people on ST
demo-crews essentially, but also free/shareware authors, who do better and better job,

and allow you to get some free/cheap softwares of good quality.

BTW, where the hell where you for 6 years not to have heard anything about computers ?!? Just wondering...

EVERY ST has the ability to Genlock. Unfortunately, it wasn't until the STe
came out that the necessary connections were provided on the back of the
computer. On the older STs, you had to do a little hacking of the motherboard
to get at the signals that you needed.

Empire was a commercial release of a game that has seen PD versions on almost every platform. It was a nice implementation, however. It is a wargame where you attempt to conquer a world while you discover it. If you want a more modern rendition of the game try CONQUER.TOS at most major Atari FTP Sites. It runs in any 16 color mode, so it is quite nice on the Falcon in 640x480. It's Shareware but allows you to play over the modem as well. I highly recommend it to anyone who loved 'Empire'.

1425. Planes vs chunky mode (was: Re: A Falcon Developer Speaks about Doom..)

Newsgroup: comp.sys.atari.st
Date: 1994-04-23 16:24:13 UTC
From: bourlon@gla.ecoledoc.ibp.fr
Message-ID: <2pbi3d$iqr@vishnu.jussieu.fr>
Source record: 188569

Planes are NEVER faster to use than chunky modes, I mean 8 bitplanes vs
1 byte/pixel and 16 bitplanes vs 1 word/pixel. And they are more interesting only "when
the size of a pixel is not an integer number of bytes, but for 256 color,
16-bit and 24-bit displays, they are just a headache to deal with." as John Sullivan said.

To draw text :
- with 8x8 fonts, you must do OR.W as many times as you've got planes => 8 or 16 OR.W
by line, vs 8 MOVE.B/MOVE.W, which are a lot faster than OR.

To draw sprites :
- with sprites, it much WORSE : either you shift them realtime, which means a lot of CPU
lost for @#$^, either you pre-shift them , but it takes a lot of memory, or you make some
generated code. But, in the 3 cases, you have to AND the mask (which must be shifted too,
implying that previous problems are doubled !) and then OR the sprite ! (You can gain a
lot
with generated routs, but it becomes hard when you need to do some clipping). In chunky
mode, you don't need masks anymore, and all your sprite can be put with MOVEs...way
faster !!! (And a ig plus is that in chunky mode, you don't plot empty pixels !)
- for bigger fonts than 8x8, it's simply some sprites (and I don't even speak about vector
fonts !)

The only case planes are faster is when you use intentionally the planes separatly. Fo
example, when you do some 3D full routs, you can speed your rout by using planes inde-
pendently, which reduces the colormap a lot, of course (8 planes gives 8 colors instead of
256!, but it allows easy transparency). And, even in that case, interleaved planes like on
Atari is not the best thing (long life to the Amiga ! :0)

But you can use the color value directly.

>For interleaved, you need only pick apart the two
>color numbers and do a little addition before you write the data to memory.

But you can use the character bitmap value directly (most times)

>Sprites are a bit more involved for both, but I think that although the
>interleaved-plane algorythm is harder to understand and implement, it gives
>you more freedom for certain effects and less for others. However, the

The first thing to worry about is getting the pixel/text/sprite drawn efficiently, before worrying about 'effects'. Ihave never used the BLITTER's SMUDGE bit and probably never will, so I don't care that this effect might not be possible if the ST's screens weren't bit planed. Bit planes win when the size of a pixel is not an integer number of bytes, but for 256 color, 16-bit and 24-bit displays, they are just a headache to deal with.

>structure of the data for a sprite could be stored in a way that matches the
>screen memory structure. For interleaved, you'd want to store seperated
>planes, while for byte-per-pixel, you'd store a list of colors and another
>list of flags.

Of course you choose the sprite format such that it needs as little conversion as possible to output, but you store the same amount of data in both cases: A table of color information, and a mask.

John

PS: I hope the code is vaguely right, I haven't tested it but it's similar to code I have done on both PC and ST

Unless you can find some of the stuff used, it may be cheapest
to just get a multisync monitor, and use it between the ST, a decent
386/486, and MacII. But sometimes ya find a deal that would make
the emulation cheaper...

Late last summer, there was a discussion about Gopher on the ST. I know that someone had compiled it and was running it. Are you still around? Does anyone know who it was, or are any of you using it?

I want this for inclusion on the FAQ that I am putting together. So any info would be appreciated.

Also what should I call the FAQ? I have been calling it a SLIP FAQ, but it looks like it is going to go beyond just SLIP. Should I keep this title for ease of recognition to new users or change it to something else more appropriate?

Thanks,

I use an NEC Multisync II with my 520STE. Works great, I made the switchbox myself.
The Atari SM124 is a bit better in hires mode, but the NEC is totally acceptable,
it's only when you compare that you see that the NEC isn't as good in hires.
Besides, the NEC is 14", so that gives 12" or so viewing area.
But I guess those new hires monitors from Atari are 14" too, aren't they?

Yes - but note, most PC hard disks are IDE *not* SCSI.

>ST. I know there are commercial products like the Link, but does anyone
>know how to overcome the slight incompatibilities?

What incompatibilities? If you mean:

"How can I connect a SCSI harddrive *without* buying some sort of comercial
interface?"

Then the answer is unfortunatly no.

The only other thing to be careful of is SCSI parity. The drive you obtain
ought to have this disabled or else it won't work with most Atari host
adaptors like the Link.

I have seen two MOD players that took very good advantage of the interleaved bitplane structure. This way, they were able to have a mouse pointer on one plane, and an oscilloscope on another plane, etc. In this case, interleaved bit planes is VERY useful.

Not as good as yours, but in HS, I had a math teacher named Richard Hardick.
Most students did not hesitate to refer to him as Dick or Hard Dick.

Actually, I've been following this stuff recently. At the end of the
summer (or thereabouts) there will indeed be a new Softwindows version,
which will *not* emulate a 386. It *will* emulate a 486, which should
be good enough, no? (;-), for the terminally literal)

: Can you help?

Is there some particular reason you need that specific program?

If not, there are probably at least two superior PD/Shareware spreadsheets on umich; I knew of two when STCalc first came out. (Of course, I didn't *know* they were superior until I bought STCalc to replace them and found that it couldn't replace either one.)

I use Sheet which is good but unstable (crashes a lot). There's another one that I have looked at, can't remember the name of it; it looked better & more stable but required GDOS to print. Since I've never been able to find a GDOS driver that worked with any printer I've ever owned, that one is a loser for me.

MegaSTE for sale:

Upgrades added by me:
4 Megs RAM
Hard Drive Host adaptor (just plug in any SCSI mechanism for an internal drive!)
1.44 Meg High Density Floppy Drive.

Standard features:
16 mhz clock speed
VME slot for adding graphics cards or other devices.
Detached keyboard, one of the best feels on ANY computer!
TOS 2.06 with NewDesk!
Stylish Case! (well, _I_ like it)

Asking: $500 (price negotiable)

Also for sale:
Crazy Dots-15 VME Graphics card for MegaSTE/TT
Comes with NVDI-ET4000 for speeding up Crazy Dots graphics output!

up to 800 x 600 at 15 bit True Color
up to 1200 x 800 at 256 colors
up to 1600 x 1200 at 16 colors or less!
24 bit palette

Upgradeable to a Crazy Dots II card for $25. Upgrade the NVDI too and get
24 bit color at 640 x 480!

Asking: $500 (list price for new CDII is $800, my price is negotiable)

|> All disk-based versions of TOS (other than developer beta copies)
|> are illegal.

Not correct.

The first ST's were sold before TOS had been put in ROM.
I bought one of these myself... and I sure was no developer at the time.
The machine came with a Norwegian TOS 0.9 or something. The best thing to
be said about this TOS version, was that it used cute Atomic bombs (mushrooms)
instead of the Round bombs used in later versions of TOS. You got to see these
mushrooms a lot though...

I still have the original disk, but I have no 68000 machine to run it on.
Maybe version 3.0 of backward will enable it to run on my Falcon :-)))))

As for wanting to run TOS 1.0 from floppy to enhance game-compatibility,
this usually won't work. This is because the addresses of variables and
other stuff is different in the RAM version of the OS.
However, in some cases it might work.

The only way to get 100% compatibility, is to have several ROM versions
installed, and some kind of switch to choose which to use...

```
==============================
majority of what is done. Do you like the performance of your Atari's text
display, dialog drawing, and other things like that? The interleaved
bitplanes are partly responsible for that speed.
==============================

Uhh .. do you like the speed of text-output that is NOT 8 characters wide?
How about window scrolling? Like the speed? How about the "color smear"
- it's actual a color flicker.

You make a good argument for interleaved, but the fact is, the overhead of
using 8 different planes is just too much, especially on an 030 that can shift
much faster than a 68K, and you admitted to using shifts and masks and such
too! The algorythm for picking apart a character like that is relatively
easy and can be coded fast, and with a little work, you can get 4 pixels
in 1 clock cycle. Animations, line drawing and such would be much faster,
and dialogs would be the same or faster.

Wanna do the code? I've done a similar algorythm on the Intel calling BIOS
INt10h pixel drawing services, picking out hex digits from 8pixel*8pixel
cells and its almost instantaneous UNDER PC_DITTO!! And BIOS INT10h
is SLOW. With a byte/pixel mode I could just replace the entire call
with a single MOVE - actually, since I'm using color I could move 32 bit
values, but that's beside the point. You shift, on carry write a byte,
increment teh reg with post-inc, for no carry you just increment the address
or write the byte and increment (depending on drawing mode, or XOR or AND
or whatever if you like instead of MOVE). After you have shifted everything
you do the next line.

Tell me that your shift and add is faster when you need to do 8 bit-planes!!
I've got an 030 data book here with instruction timings if you wanna try.

>available)?

Yes, but the TCP part isn't yet complete. However, I have compiled Lynx
in the way you just described and it works fine for local files. It also
contains the patches to work with 'term', the serial-line multiplexer.

With luck, the binary I made will magically start to work with SLIP and term
once MiNT-net contains working TCP.

lynx for the ST can be found on ftp://ftp.twi.tudelft.nl/pub/atari/lynx/
Note that this is currently "hack-ware"; it contains the ncurses library
instead of normal atari-curses because normal curses won't do bold and
underline. This means you'll need a terminfo description of the terminal you
use. I'm using one that works with Juergen Lock's virtual consoles on a
colour monitor. (I prefer colour instead of bold)
Details are in the README files on the ftp site.

MicroSoft BASIC and HiSoft BASIC are fairly compatible. You would have to
speak to HiSoft directly for details.

The program can run at 8MHz as well. It's not processor intensive.

This makes your machine _not_ Unix compatible, but it gives it a sort
of UNIX-feel... MiNT was designed to be compatible with tos, the only
thing you get is a bit of multitasking and a filesystem that resembles
UNIX a bit. The other two statements (about DOS and APPLE) are correct.
If you want to be more UNIX compatible (more!, not complete!) perhaps
you should take a look at MINIX.

Make sure you use binary transfers on both sides.
When you ftp, be sure to use the command "bin" to request a binary transfer.
Then when transfering through Kermit, tell VAX's kermit "set file type fixed"
before you place it in server mode for the transfer. You might have to do this
on both sides, but usualy it is enough to do it just on the sender.

1467. Right border removal on the STe

Newsgroup: comp.sys.atari.st
Date: 1994-04-24 12:06:22 UTC
From: kebl0011@black.ox.ac.uk
Message-ID: <1994Apr24.120622.29202@black.ox.ac.uk>
Source record: 188357

I have just found a very useful register on the Ste that allows you to remove the left border without using interrupts. Could anyone please tell me if such a register exists that does the same for the right border. The one that I found is located at $ff8264.

Also, does anyone have any info on what this register does? I have not been able to find it in any documentation. Any other routines for right border removal would be much appreciated, as this is the only border left that I am having trouble removing!

Thanks a lot for the help.

I am currently working on "The Superb Sample Editor" for the Falcon which
eventually aims to be able to do anything you want to do to a sound sample.
It will be shareware - first version will be released in a few weeks time.
Currently in beta-testing...

The joypads can only be used on Atari STE's and Falcons, both of which have a pair of extended joystick ports on the left-hand side of the machine. It seems unlikely that any STE games will use them, although all four Falcon games from Atari need to have the joypads.

From: Stefan_Damerau@sl.maus.de
Message-ID: <199404241725.a299@sl.maus.de>
Source record: 188452

In article ap748@cleveland.Freenet.Edu (Fred Horvat) writes:

FH>What type of joystick port does the Falcon or STe have?
One the lower right side there are the normal 9pin SUB-D plugs (Male) fpr Mouse
or standard digital Joysticks (like Cometition pro).
On the left side there are two 'extended Joystick/Paddle' (named A and B). Each
port is used to connect different kinds of stuff:

- 2 standard dig. Joysticks by an adapter 2* 9pin SUB-D <-> 15pin SUB-HD
(This is used for e.g. Dynabusters on STe's and Falcons)

- Jaguar Joypad
(This is used for e.g. Steel Talons and Llamazap on Falcon)

- Maybe(!) Paddle?

To play Steel Talons on a Falcon works quite right, but the game is quite lame
:-((demo-version)

1476. Falcon game developer support (was Doom for Falcon?)

Newsgroup: comp.sys.atari.st
Date: 1994-04-24 15:37:43 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HBJVDRRL2A8WXZQI@SNYONEVA.CC.ONEONTA.EDU>
Source record: 188364

As most of the Falcons sold to date are in Europe a majority of the commercial, shareware, and PD game developers hail from there.

However, there are already several thousand Falcon onwers here in the states and we shouldn't be discounted by the developer community.

However, many US Falcon owners (including myself) are reluctant to support Shareware games that have no representative here in the USA. I wouldn't mind paying a few $ more for a game that I can register for here in my own country and know that I will receive the latest version in a matter of days - not weeks or months.

So, word of advice to all of those talented European Falcon developers - get a US Atari mag, software company, or even advocacy group like Atari United! to represent your software over here!

Heck, US shareware authors have used similar set-ups to market their programs in the UK and Germany...

Think about it...

If you like my idea, I can e-mail you lists of addresses of all of the US Atari developers and organizations I know of (and I know quite a few).

1482. Civilization Bugs and Civilization on a RAM

Newsgroup: comp.sys.atari.st
Date: 1994-04-24 17:45:05 UTC
From: ae-a@minster.york.ac.uk
Message-ID: <767209505.90539@minster.york.ac.uk>
Source record: 188341

If you are playing civilisation on a machine with 2.5 Megabytes
or more of RAM, you might like to use a ram-disk. This is faster than
a floppy disk, and should be faster than a hard disk.

If your ST only has 2.5 Megabytes of RAM, you would have to use MAXIDISK
(version 2 or above) which is a ramdisk that compresses the data it stores.
A 1530K ram disk is large enough to hold all the files and leave enough RAM
to run the game. You would also have to use PACK_ICE 2.4 to compress GAME.PRG
(PACK_ICE has a better compression tham Maxidisk, but should only be used on
GAME.PRG). Use INSTALL.PRG on your civilisation disk to install all the
nescesary files on your ram-disk, and you can now have a faster game.

Has anyone else noticed the following Bugs in civilisation?

When running Civilisation from floppy disk, if you chose to have
animations, the game crashes if you trade technology during
a negotiation.

Also, when running from floppy disk, the game occasionally seems
to be reaing the disk forever. When I getfed up and swap disks
for one of the other game disks, after a while, the game continues.

When you ask for a revolution, the playing area goes black. This
can be cured by viewing a different area of the map?

Has Microprose prodiced a fix for any of the bugs mentioned here, or
are there simple methods to cure these problems?

AE.

W O R K S H O P A N N O U N C E M E N T
PLEASE POST/CIRCULATE

-=-
COMPUTED ART INTENSIVE
New Media Technology in Performance
July 4 - July 22, 1994
Vancouver, Canada
-=-

Presented by the Simon Fraser University Contemporary Arts Summer Institute,
in association with the Centre for Image and Sound Research.

-=-=-=-=-=-=-
THE WORKSHOP
-=-=-=-=-=-=-

Computed Art Intensive is a three week workshop offering a concentrated "hands-on" approach to computer-assisted new media technology in performance. Professional artists and advanced students from areas such as dance, music, theatre, visual art, design, video and animation will explore new creative possibilities being opened up by evolving computer technologies, and will develop skills for using and further exploring these new media tools.

The workshop is made up of two main components: "Access to Tools" and "Interactions in the Active Space".

Access to Tools

During the "Access to Tools" component, participants in the Computed Art Intensive acquire and develop skills in the use of computer based tools and how they can be used to support interactive performance. Tools are expected to include:

-- Macintosh, Atari, & Silicon Graphics computers

-- MIDI protocol, a standard for communication between digital musical instruments and interactive new media technology in general

-- Max, an interactive programming environment which allows "visual programming" of custom MIDI processors

-- Forth (customized version), a programming language ideal for developing interactive systems and sophisticated MIDI programs

-- Life Forms, a computer animation system for creating simulated human figure movement sequences

-- Ariel, a MIDI-controllable image processing system that applies computer special effects to digitized video sequences

-- @FL, an interactive graphical programming environment for lighting design which represents cues as sets of behaviours and processes

Interactions in the Active Space

During the "Interactions in the Active Space" component, participants in the Computed Art Intensive apply and refine skills and software programs in the Active Space, a fully equipped theatre. Directly influence technical elements such as lighting, sound, and projected images by means of touch, location, movement, and voice sensing systems. Explore methods of working interactively in an environment mediated by advanced technology. Sensors, devices and computer systems are connected in flexible, easy to modify, ways to allow response to the changing needs of the performers. Experiments may range from investigations of the possibilities and constraints of particular sensors, to group improvisations in structured interactive environments.

-=-=-=-
FACULTY
-=-=-=-

JOHN CRAWFORD, program co-director, is a theatre director and software researcher working on the development of interactive live performances in which advanced computer-based technology creates a mediated environment to augment the experiences of performers and audience. He founded Explorations Workshops and has taught at the University of British Columbia and the BC Institute of Technology. He is currently Intelligent Graphic Interface research project leader at MPR Teltech in Vancouver.

MARTIN GOTFRIT teaches electroacoustic music and film sound at Simon Fraser University (SFU). As a composer his work includes scores for feature and documentary film, video, theatre, dance and the concert stage. He has also been the founding member of several improvisational ensembles, notably Metamusic, Hextremeties and the Giza All Stars. One of the founders of the Centre for Image and Sound Research, Mr. Gotfrit has been a part of many projects involving computers and the arts.

GEORGE LEWIS is active in 21st Century art and music as a composer, performer, and computer/installation artist. With a background in philosophy, he is a prolific artist whose work ranges from appearances on over eighty record albums as a trombonist, through interdisciplinary and computer compositions, intermedia installations and "interactive music videos" presented across Eastern and Western Europe, North America and Japan. Mr. Lewis has taught at SFU, the Royal Conservatory in The Hague, and the Art Institute of Chicago. Currently he teaches music at the University of California, San Diego.

DANIEL SCHEIDT pursues an active interest in software as a compositional medium by creating interactive music systems designed to respond to acoustic input from live performers. Recent works employing computer generated text and multiple player pianos have been performed at both ends of the Trans-Canada Highway.

THECLA SCHIPHORST, program co-director, is the Artistic Director of the Computer Graphics Research Lab at SFU, a choreographer and performer, and a member of the design team that developed the LifeForms choreographic software. She has been working with Merce Cunningham in New York City for the past four years supporting his creation of new dance with LifeForms. She has been a faculty member at Emily Carr College of Art and Design, and has also taught computer science and contemporary dance.

The faculty is augmented with several outstanding artists and technicians who are expected to include:
LOUIS PHILLIPE DEMERS (lighting/software designer)
SARA DIAMOND (video artist)
BARRY HEGLAND (lighting designer)
SANG MAH (systems coordinator)

-=-=-=-=-
LOCATION
-=-=-=-=-

The workshop is held at Simon Fraser University in Burnaby, a suburb of Vancouver, British Columbia. Situated atop Burnaby Mountain, the campus overlooks Vancouver, Burrard Inlet, and the Fraser River. Participants may stay in Residence at the university. Downtown Vancouver is 45 minutes away by public transit.

-=-=-=-=-=-=-=-=-=-=-=-
APPLICATION PROCEDURE
-=-=-=-=-=-=-=-=-=-=-=-

Professional artists and advanced students will be selected on the basis of experience as reflected in their written applications. Please call (604) 291-4672 to receive an application, or email the following information to Tanya_Petreman@sfu.ca:

-- name, address, day and evening phone
-- a current resume, including training, performing experience and computing background, if any
-- a statement which includes your reasons for attending and expectations of the program

DEADLINE FOR RECEIPT OF APPLICATION IS MAY 2, 1994
Late applicants considered only if space is still available.

CREDIT STUDY: Eligible students may register in FPA 388-3, Summer Session. University registration and department permission are required. Full credit course fees are payable to the Registrar in addition to workshop tuition listed below.

TUITION: The fee for the workshop is $800 (Canadian funds), which includes accommodation in SFU Residence. Once accepted, a $100 deposit is required to hold your place. Payment of the balance must be made by June 1, 1994. Tuition is not refundable except in cases of medical emergency and an administration fee will be applied.

FINANCIAL AID: We encourage you to seek assistance from employers, government, and private cultural agencies. Apply early! Some financial assistance is available through the institute. Please contact our office. Such assistance will normally not exceed $250, and not all requests for bursaries can be met.

1485. MegaSTe for sale

Newsgroup: comp.sys.atari.st
Date: 1994-04-24 18:49:34 UTC
From: j.dewell@genie.geis.com
Message-ID: <9404241849.AA18406@relay2.geis.com>
Source record: 188375

April 24, 1994

Greetings! I am selling my MegaSTe. It has 4 megabytes of RAM, the famous Atari 50meg hard drive, TOS 2.06, and a 68882 (and of course all the other neat stuff a MegaSTe has). I am asking $700 obo. My GEnie address is J.DEWELL, my Internet address is j.dewell@genie.geis.com, and my voice phone number is (408)246-9863. Thanks! Later!

Jack Dewell

This is being posted again because I goofed on my Internet address last time. Sorry, squire...

Ok, time for the incredibly simple solution for the bitplanes problem:

rotate the monitor 90 degrees.

Just 1/2 :-)... I haven't been programming in assembly for ages, so how would it be? For Wolf3d you need to stretch vertical stripes of pixmaps and then display them... at least the plotting would be really simple and fast, once you got the pixels stretched... but how would the stretch algorithm's speed be?

Let's say you make the prog to build the algorithms for different scaling factors, for instance if there's a tile, 64 pixels high, that needs to be stretched to 160 pixels, you make a routine that takes for each bitplane a bit in the data and alternately sets either two or three bits to the corresponding place on screen (or to a data reg which is moved to memory then it's all done, I guess it'd be faster like that).

Dunno, sounds a bit slow, and not all cases of stretching would be that neat... not to talk about the need to turn your monitor on it's side when you want to play :) but there HAVE been games that required that, at least on the good ol' c64!

Well, I guess it was a bit far-fetched...

> Anybody know what that's all about?

Wow! I can only guess. BIll Yerger runs (ran?) an Atari & PC store in Berkeley called "Micro World" The man was a scum, and frequently ripped off customers, myself included. He sold me a refurbished monitor calling it new and took mu money for a monitor master which was not instock and never seemed to have been oprdered! It took me a few months to get my money back. "OH, the check is in the mail" "Yep I sent it out last week" and finally "Oh I guess I never sent it out" I stopped doing businedd with him after that. I'm sure I'm one of the small stories. Ask anyone in the Berkeley Atari community and I'm sure they have a horror story of their own. When I called Atari asking about the monitor, their response when I told them who it was was "oh. No comment." Luckily ATY in Oakland is only a short drive away, and Alex of ATY is a great guy!

I don't specifically know the nature of the lawsuit, but if anyone deserves to be sued it's Bill Yerger. He apparently lost his "Authorized Dealer" status a while ago, but still kept the sticker on his door... Oh, just reread and HE sued ATARI? hm... Probably felt that they hampered his criminal operations somehow...

I've got the following system for sale:

- 1040 ST w/ new Mega power supply, new TEAC DSDD
and an installed 4 meg upgrade board containing 256 K SIMMs
- 43 meg Quantum HD w/ ICD AdSCSI Plus host adapter card
- SC3000 monitor w/ SSDD below monitor
- Gravis Mousestick
- Supra 2400/9600 modem/fax
- Flash II, Warp II, miscellaneous public domain & etc
- 9-pin Epson emulating printer
- cables, power supplies, books, manuals, boxes incl.

Everything works great in the usual Atari fashion.
Didn't get around to doing MIDI as planned, so here it is...
Want $425 incl. shipping. Will consider piecemeal offers.

Sb: #96930-#Yerger Lawsuit
Fm: LEXICOR Software 75300,763
To: PG Music 71333,706 (X)

Kevin,

The law suite was by a berkeley Atari store, against Atari Corporation. I
was a witness for Atari and while I don't claim to know the whole story I can
fill you in a little bit.

The store owner not so long ago lost his dealer status due to some
accusation that he was involved in manufacturing pirate TOS ROMS, what amounted
to Priate Atari computers and was involved in a number of other business
practices which reflected badly on Atari in general, and was so I understand
violations of the stores distribution agreement. Such things as selling
computers mail order and the like.

The store owner filed a law suite against Atari claiming amoung other
things that Bob Brodie and some others ruined his deal to distribute Retouch in
favor of GoldLeafe, which cost the owner several hundred K or so he claimed.
The owner claimed he had "verbal" consent to burn TOS ROMs for
customers, and much more.

The trial was in front of a single judge, no Jury.... it was a basic
civil suite between two companies.

While there may have been some criminal activities surrounding
copyrights, the case was brought by the Store owner and not Atari, although
Atari did file a counter suit which it settled durring the trial.

Theres lots more but maby others would like tojump in and relate their reactions.

> what is going on. Can someone please fill in the
> blanks for the last couple of years.

Well, since then Atari has released the Mega ST (external keyboard etc), the STacy (portable), the STE (enhanced ST), the TT (32MHz 68030+FPU), the Mega STE

(16MHz), and their latest bird the Falcon030 (which I also own). The TT and Falcon are the only two computers that are still manufactured.

Atari has lost most of its old userbase to PC and Mac. They are currently concentrating all their efforts in their new 64bit game system, the Jaguar. It will either make or break Atari. They don't have the financial resources to withstand another marketing fiasco. But they have showed much promise so far, and have already sold over 100,000 units in the US.

Atari are also still making their portable game system, the Lynx (developed by Epyx). It seems it will have a second life after all.

> finally downward(!!!!!!) compatible with the Amiga?

Yes, old Jack is still around but his sons run the company these days. PC is number one everywhere, like it or not. Atari today is a very small company. I guess quite a few people are still using First Word
Plus (old habits are hard to kill). But Atari Works is so much better! And yes,

the bombs are still there, though my Falcon seldom has a reason to show them.
TOS has come a long way since version 1.0 back in 1985.

>Do you have a list of software that you have tried and really works. Does it work on OS/2? What type of machine and slots can I use ie. 486 66/Mhz or Pentium? I am sorry I am asking these questions but I am really interested in buying this but I want to know if it works.
>
> Orlando
> osantiag@motown.ge.com
>

Why would you want to use a GEMulator? It almost makes sense to emulate another computer on an Atari, especially Mac since the Spectre GCR crashes less than a real Mac, and then the PC emulators have some nice features, but to emulate an Atari on a PC sounds kinda silly. You could spend less money and get a REAL Atari and run your software faster with better compatibility.

1499. Jaguar Info wanted

Newsgroup: comp.sys.atari.st
Date: 1994-04-25 00:47:56 UTC
From: thaanuj@CSOS.ORST.EDU
Message-ID: <2pf3vs$r3a@jadzia.CSOS.ORST.EDU>
Source record: 188403
Cross-posted to: comp.sys.atari.st,rec.games.video.atari

The following is posted on behalf of a friend of mine. He has been assigned a paper discussing strategies employed by medium-sized businesses, and has chosen Atari Corp, more specifically the Jaguar.

If you have any information on latest sales figures, current buyers and suppliers, distribution channels, relations and agreements with developers, and release dates of future products, a response would be very appreciated. If you can mention the source for the info, it'd be even better.

Rumors, heresay, and scuttlebutt are also welcome, since such info may help to round out the big picture. It's well known that Atari Corp pulls unpredictable actions, so rumors may be as useful as hard figures.

Thanks in advance,

(who knows, you might even be listed in a Master's Bibliography!)

1500. STE T28 Accelerator Coming...

Newsgroup: comp.sys.atari.st
Date: 1994-04-25 01:34:29 UTC
From: cb170@city.ac.uk
Message-ID: <cb170.767237669@Victoria>
Source record: 188395

I talked to a guy on the System Solutions stand at the MIDI and Electronic Music Show at Wembley Conference Center this weekend, and he said that there definately is a STE version of their accelerators in development, hopefully to be available in a couple of months.

For anyone who doesn't know, there are two accelerators available for STFMs or MEGA STs, the T28 and T36, to take the CPU's clock speed up to 28 and 36 MHz respectively. They cost 199 and 289 UKP pounds respectively. And STE owners will be able to get a version that works with their machines. Yay!!

This is good news -imagine Calamus SL + T36 + NVDI.
Extremely powerful and fast setup!!

There are several shareware distribution outfits in the US and they are certainly valid candidates for this type of thing. Some have been in business for years and have built both reputations and mailing lists.

I see no reason why such a thing should be illegal. It is already done by several individuals here in the US for certain Shareware products (connect for one). It is done for American shareware stuff in the UK ((Goodman's for one).

Shareware authors should research the possibilities. Those vendors and/or developers should have a good reputation and the resources to actively support each product, etc.

Such an arrangement is akin to Export Management firms used by other types of businesses. These distributors know the host country and the market.

This is an excellent way to ensure that both developers and users needs are met.

1504. Re: GFA BASIC -> GFA BASIC for WINDOWS

Newsgroup: comp.sys.atari.st
Date: 1994-04-25 02:04:21 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HBKHEHTIAW8WZ4RE@SNYONEVA.CC.ONEONTA.EDU>
Source record: 188396

As far as I know, as of GFA v3.5E, GFA was trying to promote cross platform capabilities with Amiga and PC versions of GFA Basic.

As long as you stay clear of machine specific peeks, pokes, and hardware registers, etc. most GFA commands should translate smoothly over to the PC. Don't forget that the PC versions were developed after the Atari versions so compatibility was most likely retained.

If you are really concerned, try contacting GFA directly about code portability.

1505. STE System and SIMMs for Sale

Newsgroup: comp.sys.atari.st
Date: 1994-04-25 02:12:03 UTC
From: men@us.dynix.com
Message-ID: <Pine.3.05.9404242052.C107505-b100000@cpu.us.dynix.com>
Source record: 188398

Computer system for sale, includes:

1040 STE, 1 meg ram (will negotiate for 4 meg ram, or will sell 4 1 meg
70ns SIMMs separately), Joystick port 1 is broken on STE
SC1224 color monitor
SF314 double-sided second floppy drive
65 meg hard drive, with ICD's AdSCSI Plus adapter (in an ugly case)
SuperCharger hardware IBM emulator with software (version 1.40)
Supra 2400/Plus modem with cable
Star NX1000 Color Printer with cable and software for printing color images
Lots of software, including Geneva, Neodesk, Personal Pascal, Printmaster,
lots of games and utilities, and a few books (atari internals, gem
reference guide, 6800 guide). Much of the software has documentation.
Some doesn't.
Blitz copy cable.
I also have a PC Ditto II, which i never got to work even though I got the
initial bad chips replaced. I'll throw that in.

$650 or best offer.

If I can't sell the whole system, I'll sell pieces.

Mark E. Nelson, men@us.dynix.com

Although Mac Plus emulation and 286 PC emulation is available for a ST, I don't think there is a Unix. And there won't be because of the lack of memory protection. A TT might work but I'm not sure if there is a PC emulator for the TT.

You'd be better off getting a 486 PC and run Linux for Unix (this is a freeware Unix-like OS for 32 bit PCs) and giving the Executor, a Mac emulator for PCs a try. I haven't used Linux or the Executor so I can't comment on their functionality. I know that Linux is used extensively so it is probably quite good. The Executor (or a demo) is available via anonymous ftp from wuarchive.wustl.edu in the pub/msdos/uploads/emulator directory.

Really? I bought a used piece of commercial software that must have been distributed before TOS in ROM had came out because it has TOS 1.0 on disk. I think the only legal version on disk is TOS 1.0 (sometimes referred to as TOS 0.9 since it was different - no f-traps used - than the final TOS 1.0 put in the ROMs).

>Is this sort of thing done/legal?

This is just the kind of thing that ATARI UNITED! would like to get involved in. We've talked with some authors about acting as the distribution agent, and support source, for shareware programs, with mixed results. The one common thread has been the inherent difficulty in establishing the trust necessary to base the arrangement upon. With our contact limited to e-mail and phone calls, it's often difficult to develop the relationship that must exist between author and agent. But, we are still very much interested in working distribution/support arrangements out with shareware authors, despite our lack of real success to date. If anyone is interested, drop me some email and I'll be happy to provide you with further details about what we're interested in doing for you.

Is there such a thing as a C interpreter? Surly it would be too slow with
having to include all the header files and libraries etc..

I've just started to dable with Sozobon C which is PD, my version is pretty
old and doesn't include libraries for GEM - but I think I have seen these
libraries around.

Don't know if this is a good compiler or not - but it does what I need

>

The Gemulator gives you more screen reseultions - you have to see the screen shots to belive it - it also allows 16 (I think) colours in the higheset reselution. So not only do you have a bigger screen, you have more colours as well.

Although I don't like to admit it, I would find it much better if I had a PC (to be compat with most of the rest of the world) fitted with a Gemulator (to be compat with all my progs and get a supior ST).

Re: compatibilty, I think you are able to install a number of different TOS chipsets.

Re: speed, I think it siad that a 386 type PC would run the emulator at normal ST speed, while a 486 would make it more like MegaSTe speed.

Note: The above info is what I have read - It may not be 100%

|> Randall Ingermanson (rsi@scubed.com) /| /| MAXWELL LABS

OK, here is the Benchmark which compares the
Windows emulation on a PowerMac with Windows
on PC hardware:

PowerMac 486 DX/33 386/33
7100/66 VL-Bus

Lines 0,81 0,22 1,16
Rects 4,30 2,23 9,64
Curves 7,30 18,80 43,30
BitBlt 4,90 1,00 3,31
Zooming 69,80 103,40 89,10
Scroll 27,00 43,90 147,20
Fill 15,50 13,70 61,30
Text 1,79 1,15 9,07
Dialog 1206,00 317,00 857,00

(time in milliseconds)

Doesn't look too bad, I think.

But of course, it is much more interesting,
how fast applications are which run in native
PPC 601 code.

Christoph

Here is an excerpt of the article concerning compatibility:

'' ... We have tested applications, utilities and games on two harddisk cartridges. Not a single program caused problems, not even the Microsoft products Word and Excel, which are known for their sometimes strange implementation. With no program, we could notify a speed loss because of the 68K-Emulation. Some games and applications which mainly use QuickDraw for graphics output or SANE for floating point operations were even faster than our 40MHz Quadra ...
... There hardly is anything more to say concerning compatibility. The emulation is extremely robust, there were no system crashes during the test ...''

Just to add a bit more, Civilization (from Microprose) is sort of like Empire (with many additions mind you), and I think most Empire players will find it an excellent game.

As a side note, anyone seen the game "Master of Orion"? It's only for MS-DOS (maybe Macs too), but it is similar to Empire (and Civ), except the battlefield is outer space. Very addictive game... Can anyone name any others (for any platform) that are similar to these 3?

Happy (war) gaming!

Perhaps you should better wait until the 'Janus' card is out in an english version (it already exists here in Germany). This ISA-card contains a 68000/16, (german) TOS 2.06 and slots for two Standard SIMMs. The compatibility is supposed to be very high. I read that it runs at a speed of an ATARI TT, because the 68K processor delegates a lot of tasks to the Intel CPU. The system is capable of using advanced PC hardware like e.g. a VL board/graphics card.

It sounds much more convincing than the gemulator of which I read that it only reaches the speed of an 8 MHz ST if you have a 486 DX2/66.

But it can overlap with the previous instruction, so that the net
result is basically the same (see also my reply to the article above).

1527. HELP: Algorithm needed!

Newsgroup: comp.sys.atari.st
Date: 1994-04-25 09:20:09 UTC
From: kllove@essex.ecn.uoknor.edu
Message-ID: <2pg209$8th@constellation.ecn.uoknor.edu>
Source record: 188468

I've got a programming question that would be perfect for c.s.a.programmers. Unfortunately, I can't wait for the group to be discussed and, possibly, created. Especially since my account is going down for the summer in about 3 weeks! :(

Okay, here's the problem.

I want to program a game and I have had no experience in writing them! I'm looking for a general algorithm that will get me started writing games. Below are a few of the things I want to do.

If you can help me with any of these (especially the CPU speed independence for timing of the various events in the game -- i.e. moving an enemy ship every few centons), please send me e-mail. I know C and Pascal, and I have the Atari Compendium. So, feel free to sling code at me, I should be able to figure it out. Are any books available on the subject of writing games? If yes, then what are they?

* Create a scroller a la Ikari Warriors (yes I know there are too many already out there :) *OR* a Lemmings like platform game but with only one character per player.
* As you've probably already guessed, I want the game to be 1 or 2 players.
* Use GEM/AES routines to do all graphics and event handling.
* Use the original Atari joysticks, the mouse, and the keyboard for various operations. Any of the three might control movement of the players' character at any time. The mouse could also be used for accessing menus, answering dialogs, etc. The keyboard would be used to pause the game, save the game in progress, enter data where necessary (passwords to an in-game computer network, for instance), etc. The joystick would be for moving and firing only.
* I'd want an "attract mode" similar to the Jaguar's Raiden. I could get by with static screens, however.
* I want to make the game resolution independent (maybe color independent as well, but I'd prefer to have at least 16 colors available). Maybe requiring a resolution of at least 320x200 wouldn't be a bad idea, but I've never seen a resolution smaller than this. If more is available, run the program in a window. Or use the entire area available. Which would be easier? Which one would be better?
* CPU speed independent. i.e. 8/16/32/40/48/whatever MHz it doesn't affect gameplay. Even better though would be faster frame rates for the faster processors.
* An encrypted, high score table.

* Sound capabilities (like explosions, missile launches, etc. and/or a short music sequence for background music) would be nice but definitely not essential (at first anyway).
* Online help (context-sensitive if possible) would be somewhat unneccesary, but a great addition to a utility or application.
* Keyboard independence (i.e. CTRL-S is always CTRL-S and doesn't depend on the location of the S key on the keyboard). I don't want to come up with a game that works only on U.S. machines!

Well, that's all I can think of right now. If anybody wants to send me their source code for a game, let me know before hand please.

Many thanks,
Kenneth Love

|> Is Jack Tramiel around? Is the ST still the Numero
|> Uno in Europe and the UK?
The Tramiel clane still run things but jack is quiet these days. They no longer make Sts although They have admitted they may have killed it prematurely and may start manufacturing again - they have many '000 outstanding orders. The only computers they do these days are the TT and the Falcon. The latter is/was pushed as a multimedia machine due to his nice graphics and sound. it has a DSP like early Next machines have and can do nice audio things eg Cubase Audio gives you 16 tracks of direct to hard disk sampling. You can also do real-time manipulation of audio to get various effects. The graphics allow upto 65000 colors on screen and hi reses too. The graphics are fully programmable for x/y/bitplanes. I have had 1400x900+ on mine although the refresh dropped to 50Hz and got a bit hard on the eyes. It has a 68030 WITH OPTIONAL 68882 CO-PRO, UPTO 14MB OF RAM, A MULTITASKING (sorry, hit caps lock) OS called MultiTOS and runs the majority of ST software and many ST games too. I really like mine but for theprice - 900GBP, it's a bit underpowered in the processor dept ie 16Mhz. 32Mhz would be better. You can get processor upgrades, PC emulators etc. for it so it's not too bad.

New ST software still comes out but not as much as before although some of the very best stuff is now appearing as the market has matured.

|> Has Atari finally came up
|> with the UNIX, PC and ST all-in-one box compatibl
|> machine? What happened for the last six years?
Atari did have a Unix port of SVR4 but it only got as far as developers. A pity. It had X windows, full development kit etc. You can get various PC and a reasonable Mac emulator. The PC ones are currently stuck at 386SX but there is a Falcon one on the way that will use the 486.

|> Does anyone still use first word plus? Do you still
|> have the cherry bombs on the screen when the ST goes
|> into limbo? Questions of questions -- is the Atari ST
|> finally downward(!!!!!!) compatible with the Amiga?
Frankly, the Amiga 1200 is superb value for money compared to the Falcon but lacks some of the nice bits like the DSP, SCSI port etc.

Atari have suspended TOS development for a while until they get properly upto speed on their killer games console, the Jaguar.

NO! Because of the way this board addresses you MUST have 4megs in your
machine first. It has 2 simms slots, so you can plug in 2 1meg simms for 6meg
total, or 2 4meg simms for 12meg total. No other combination is allowed.

: This is good news -imagine Calamus SL + T36 + NVDI.
: Extremely powerful and fast setup!!

Yes, it is good news, but how much longer are they going to keep us waiting?
Way back near Christmas....November really, I enquired about the STe version,
and was told, that it is under development, and should be available around beginning of
February. Right I though....I'll save my pennies for the day.

February came, and I enquired again, this time to be told, end of the month.
:-(

Never mind, They should be there soon......how wrong I was, they still haven't arrived.
Phoned up S.S a about a week ago, and was told that they do not know
when to expect them, as they do not know what's going on. They have already been developed.
They even said they might not get them???

However, if two months is the wait, then OK, but knowing these companies....all
of them really, it will be another 6 months before we see these.

I am not an optimistic guy.

} The minit.prg and minix.xfs in MDK are out of date... replace them
}with the newest ones on a.a.u.e ...

Well out of date, actually.

I'm sorry for this, folks, but I've got even more problems now that
I've gone to a Falcon - the libs I use are 030 specific. This means
compiling the programs for the 68k and the 030 separately. I'm doing
this, slowly, and hope to have an up-to-date and easy-to-maintain
archive available this Spring or Summer.

If the original poster wants to get in touch via email, I'll do my
best to answer - I always respond to email.

ATB,
Simon.

I also here that the PC version is far better...!!

There was a chap on GEnie that did a good list/reviews of Atari Games each
month..

This has now stoped do to the lack of new games, facts not fiction,
also UK mags have very little reviews of New Games in them facts again..

Also I would not claim that one games is a lot, so I still state that there is
all most zero games coming out fot the Atari platform...

True, but to their credit, it is not them having the problems, its the
developer of the board. There isn't much they can do if the developers are
taking too long. They may be all sorts of unexpected problems.

I'm just glad that (hopefully) we shall be able to buy such an excellent
product, and I'm willing to wait as long as it takes (well, maybe not TOO long!).
After all, if it was rushed to the market with flaws, there would be many more
complaints...

Roger, Roger, Roger.....
I thought long and hard before buying my Falcon. I looked at Macs, PCs and Amigas. I have had nothing but Ataris since 1980 but I was ready to consider all options. After much thought, I decided even at 900GBP, the Falcon was what I wanted because at the end of the day, I really like my ST software. I like Superbase, That's Write and all the various applications I use. I just wanted more speed, colour and sound. The Falcon has given me that and much more. It has put the fun back into my computing. It has that undefinable 'something' that all those no-personality PCs don't.

I will soon be buying a multimedia PC too because I want access to all those CDROMs with encyclopedias, movie info etc. That is the one and *only* thing a PC can offer me. I will still use my Falcon for everything else.

Even having bought the Falcon, I have still spent on it. I know it's dead, no market, no products etc., (you reckon..) but I have bought an accelerator card, 68882, new HD Driver as well as Falcon enhanced software. I AM VERY HAPPY WITH MY FALCON AND DO NOT REGRET BUYING AND NEVER WILL.

1541. Need advice: How to speed up my St520+

Newsgroup: comp.sys.atari.st
Date: 1994-04-25 11:53:49 UTC
From: krienke@informatik.uni-koblenz.de
Message-ID: <2pgb0d$av0@newshost.uni-koblenz.de>
Source record: 188493

Hello to everyone,
I'm owner of an 520St+ (1MB Ram) running Tos 1.4.
For a long period of time I didn't use it quite much. No I rediscovered it
and would like to bring it up to date.
Because I don't know what is up to date now, I have some questions:

- I would like to buy a new TOS-Version, if it is worth while. I heard about
Mutitos. What new featrures does it offer? Can I run my old programs
with the new tos? Is it faster than Tos 1.4? Do I need more tha 1 MB Ram
to use it ? Where to get it ?

- I heard about harware extensions for the ST (68020 or 68030 cards). Are those
solutions bound to a particular Tos-Version? Do most of the old Programs
run with them? Are there known Programs that dont ? What vendors offer such
a card and would you say that this product is good ? How much will it cost ?

- How much Ram can I add to my ST ? How much will it cost ? Are there known
problems with Ram extensions ?

Thank you very much for answering me.

R. Krienke

I would Love to find out where you can get a 486Dx/33 for 600 dollars. All the places that I have seen, Been a 486 costs way over 1200 dollars. which is the price of the Falcon. A friend of mine bought a 486Dx/33mhz for 3000 dollars and that didn't include a Sound card. Which would cost alot more to compete against the Falcon.. The Falcon does have 50khz Stereo sound. Which I haven't seen on the IBM yet...

I was also wondering I have seen your posts in this net and you constantly put down the Atari, Are you even an Atari owner. If not then get the hell out of this net. I thought this Net was for the Atari range of systems. Not IBM/NeXt machines. Go to their Nets and bash the Atari there. They might like it. Tell them I sent ya.

|> thought especially Atari developpers we're cunning in doing great things
|> with software, where other platforms had hardware (and costed more $$$).
|>
|> Joost.

Ah but although you do 16 pixels at once, it doesn't help much because you have
to use one AND and one OR and a lot of rotation so it slows you down a lot.
(also remember each logical op is a read-modify-write operation, and so is a LOT
slower than a move).

So: AND and OR take 2-3x longer than MOVE
you need 8 ANDS, 8 ORs and 8 ROtates of some kind to produce 16 pixels of sprite
In comparison you need 1 MOVE to print up 1 Truecolour pixel
So you need 16 MOVEs to print up 16 pixels

Therefore, Truecolour sprites are up to 3x faster than 256-colour sprites. They are
even a bit faster than 16-colour sprites, and they don't need a mask either in
the sprite format I've worked on.

The same isn't true of backgrounds, and other large areas that can be done
in a straight copy. However you can wangle this with hardware scrolling for
most sprite-based games, and draw-undraw sprites could provide a massive
speed increase if the total number of replaced pixels isn't too large.

However, since Doom isn't sprite-based, this doesn't realistically apply.
In Doom, the problem is getting a texture-mapping routine to go at totally
buggeroff speed. And despite my esteemed colleague Griff's assertions, I'm
not convinced that you can get data in and out of the DSP fast enough to
do the job. Especially in 256-colour mode.

Dave

Hello

How do I network an ST in an ethernet environment?

Here at work at HENSA/micros, all the other computers are networked, and the only way to network from this office is via ethernet. I am hoping to network the Mega ST2, and hopefully a Falcon when we get one.

BTW, there is a SUN sitting in the room too, maybe a serial network could work. However, this I fear maybe too slow.

Any ideas?

Danny.

I fell for this one as well, it's NVDI. It disables the blitter in 256
mode simply because NVDI is much faster than the blitter which slows it
down at this mode.

I have been tinkering for hours, trying to write a quick memory move function for my Falcon in Assembly, but it's just not fast enough. The fastest code I can make can only move 320x200 truecolor at 15fps, which is, in a word, LAME. I have seen plenty of demos that do full motion on 640x400 truecolor, so there must be a way of doing it. What, do I have to use the blitter in HOG mode? I don't know how to do that. I need code that will copy 153600 bytes in 1/60 second or less. Can anyone provide me with such code?

I have tried a few tricks. Everything from a move.l/dbf tight loop to careful tricky use of movem.l to move memory. The movem method seems to be the fastest, but 15fps just isn't fast enough. Who can help?

I did some trys to clear a 320x200xTC screen. The fastest way I found is the simplest too :

```
movea.l Screen_Adress(pc),a0
moveq #0,d1
move.w #320x200-1,d0
.cls:
move.l d1,(a0)+
dbf d0,.cls
```

It's even faster than movem. But, I clears only 185 in one frame, at 50Hz...

MB.

P.S.: Has anyone got something better ?

>This makes your machine _not_ Unix compatible, but it gives it a sort
>of UNIX-feel... MiNT was designed to be compatible with tos, the only
>thing you get is a bit of multitasking and a filesystem that resembles
>UNIX a bit.

This is true. But considering how much a pain it is sometimes to
even "port" things from one unix-flavor to another (like ultrix, etc)
the MiNT combo almost seems like another flavor of unix. For instance,
there's a nice FTP clone available in C-source called NCFTP I believe,
and to put it simply, it doesn't quite work with the unix system I tried
it on here because my system uses a different flavor of sockets - and
this is supposed to be portable unix code (the author was who informed
me of this problem). So true, the MiNT combo is not unix, but it
sure feels like it :-)

I've seen people on the net flamed (well, toasted anyways :-) when
they've uuencoded and posted a unix EXECUTABLE file rather than the
source, because that executable is NOT compatible with all the unixes (unixi?)
out there. So the term "unix-compatible" is rather dodgy
(it's more reasonable to say ST-compatible or PC-compatible, since
a particular executable would run on most all of such line, etc)...

I'd be tempted to try porting NCFTP to the Atari once the mintnet/sockets
angle is more developed, just to see if it would work...

Anyways, when I boot up with MiNT/minix.xfs and TCShell, and have
all those fun unix commands (ls, mv, ps, etc) and GCC, it's hard
to tell that it's not unix. Besides, I can get away with stuff like
this on both my Atari and unix box at work:

```
zoo -extract filename.zoo > /dev/null &
```

--
>>| "Some say the glass is half full,

1562. Elite Combat and other tips wanted ...

Newsgroup: comp.sys.atari.st
Date: 1994-04-25 15:11:02 UTC
From: storm@fwi.uva.nl
Message-ID: <2pgmi6$hh@ow8.fwi.uva.nl>
Source record: 188410

I'm playing elite now for about 4 days and came up with some probs:

First (and most annoying): My autopilot doesn't seem to want to
land on planet surfaces and only in stations (is this a bug or
a feature?) I never made it myself (So THAT'S! why I sold the
atmospheric shielding !)

Second: I have never been able to hit a ship by flying and targetting manuel
while having engines on. I follow them constant on 1.5 km or so but
never hit them although I frequently think They should have been hit

Third: After my first smuggling I've never been able to smuggle again
without being caught : Does anybody have some other experinece by buying
lot/s of other goodies and little illegal (covering up?)

I bought as soon as possible a adder ship to increase my loadspace.
I don't have missiles on board since I believe I should be able to
shoot the guys down (I can't)
I must say That I find it a bit buggy and obscure game (saving in
a non-existing directory crashes the game *yuck*) The manual is
VERY bad and not exhaustive (a feature again ?:), but the gane
has great potential . So please tell me ALL your advices and I'll
try to keep you up to date of mine.

I could reproduce the bug on ma Atari TT with gcc 2.4.5 and gas 2.2. The bug is not triggered when using double instead of float or when compiling with the -m68881 option. Optimization makes no difference.

IMO this is definitely a bug. I am not aware of any circumstances under which a 'float = float + int' type assignment expression is undefined or otherwise allowed to fail by any C standard.

I would be very interested to learn about the reasons for this problem. Any gcc guru out there who can explain?

I was distinguishing between two-player and multiple computer games,
but since you bring it up (and since one sort of implys the other) . . .

- Modem/Null-modem/MIDI games -

Falcon - Awesome null modem dogfighting.

Populous 1 & 2 - fast, even over 1200 baud lines. Much better game when
two humans are involved (given roughly equal skill). Can cross-play with
PC/Amiga versions of the same games.

MIDI Maze 1 & 2 - Excellent for up to 16 players/computers. 3D Pacman with
guns (yes!).

Stunt Car Driver - 3D solid vector stunt car racing. Very very good with two
players/computers, a bit boring without. This is a party favorite in my
house. Anyone can play this and have fun.

Rayoid - Asteroids-style combat game. Fun, but no lasting appeal. The
foundation is definitely there for a great game though (Rayoid II?).

Now that I have two machines at home, I would like to find some more good
modem/null-modem/MIDI games. Please post any suggestions.

Is this Jim Allen of T16 and T25 fame? He offered to make me a STE
specific T25 on GEnie, by hand! I know he's WORKING on an STE version
but said that there was something about the boards he's using that
won'd allow him to make an STE one... He'll have to make an "adapter"
or something... That's all I know... He seemed quite nice from his
posts!

On the other hand, several people from GEnie warned me in private
email that he was not the best person to be dealing with. One used
the word, "crook".

Make your own judgements!

I have read about two two STE-specific games that were planned for release a couple of years ago. They were Steel Talons and 4x4 Rally (or something similar). Does anyone know if these (or any other STE-only) games were released?

My understanding is that there are several STE-enhanced games (that is, they do more when run on an STE, but will also run on STs). The Chaos Engine is supposed to be one. Can anyone name some others?

Thanks in advance.

I believe Atari was working on a version of SVR4, but I don't think
it ever got past the developer stage (due to licensing costs, etc)...

> to use it ? Where to get it ?

Hardware-wise, TOS 2.06 is the latest TOS you could use in your
system *if* you get an extension hardware like the TEC Board. The
compatibility should be pretty high between the hardware TOS's (if
anything won't work, it would probably be games, like those with
copy protection)...

As for MultiTOS, you'd probably want at least 2 megs RAM as MTOS
eats up a bit. If you're limited to 1 meg at the moment, you might
also look at Geneva from Gribnif - it doesn't have the pre-emptive
multitasking of MTOS (nor the loadable filesystems, etc) but for most
things it would work good for you - I think it eats up no more than
150-200k RAM or so. Both are nice extensions to your system.
MTOS at the moment is supposed to be a bit sluggish - perhaps when (if)
Atari released AES 4.1 then that'll speed MTOS up a bit...

>- I heard about harware extensions for the ST (68020 or 68030 cards). Are
> those solutions bound to a particular Tos-Version? Do most of the old
> Programs run with them? Are there known Programs that dont ? What vendors
> offer such a card and would you say that this product is good ? How much
> will it cost ?

I *think* the only available 68030 upgrade for the ST's right now
is the Turbo030 (and Tinyturbo) from Jim Allen (I can't think of his
company's name at the moment - uh...). You need to have at least TOS 2.06
to work with the 030 (Jim might have TOS 3.0x onboard, as that is the
TT TOS). Dunno about pricing (other than it's a bit out of my price
range) or compatibility...

Gadgets by Small also had an 68030 board out for the ST, but I don't
think they produce them anymore...

>- How much Ram can I add to my ST ? How much will it cost ? Are there known
> problems with Ram extensions ?

Technically 4 megs RAM is the max for an ST. The Turbo030 will
allow you to have even more. And some extra memory stuff has been
chatted about lately on this net - you might wish to look at some of the
earlier posts.

When I had my 1040STfm, I had a ZRAM-3D ram extension in. It worked
well for awhile, but I started having some problems (crashes, etc) due
to some bent pins that kinda come with the territory, and finally
just said "screw it" and got a MegaSTe (which was easier to upgrade,
as I could simply pop in SIMMs into it)...

Hope this helps...

TM>bit planes is VERY useful.

That's the only use: programs which overlay the planes with different
contents. In the case of a mouse pointer, I think this is overkill, but it can
be used in games (independently scrolling background and foreground). This can
only be used in 'dirty' programs which bypass the operating system.

When using VDI and AES, you always have to manipulate all planes
simultaneously to set a pixel, draw text etc. - and then separate planes are
slower and more painful to look at (when scrolling, the text changes color
shortly because theplanes are copies one after another). Using an editor on
Falcon 256 color mode is not a thing i want to do for a longer time.

RS> this extra Ram, are they not limmited to 4 megs....

They are - normally. Martin's circuit wraps around all those chips, and adds extra address bits in all registers (video base, DMA, blitter, ...) so that the software can simply use the additional RAM without any changes. The TOS recognizes the RAM automatically (no auto program etc.) and moves the screen to the end of the RAM. The only thing that does not work above 4MB is STE-DMA-sound.

You will not want to install the board yourself, though - it involves cutting some traces on the board, and soldering *many* cables to the board, some of them directly at the custom chips (about .6mm pin spacing I think).

For more information, mail Martin directly.

Yes, I know that they cannot do anything, if the developers are having problems. I know a couple of developers who I test for, and it is a slow process. However, I am only human, and do get frustrated waiting for so long for something. Especially when told that it has been developed, but they do not know what is happening next, and they may not even get it!!

: I'm just glad that (hopefully) we shall be able to buy such an excellent
: product.

So am I really, and I will wait for it, but the wait is killing me. What's the point me buying it, once I've gone and bought a Falcon?

: After all, if it was rushed to the market with flaws, there would be many more
: complaints...

Yes, I agree with you. But surely it can't be that hard once they've got the ST version. Especially, and I say this again, a person from SS told me over the phone that it was already developed.

I quite like SS, they give good service. Most of the people are quite nice and polite. Just a few that you get on the phone, that are a bit rude when talking to you.

So how long does anyone wait for something? Before getting frustrated...me I wait for a couple of months.

Dan.

Right - they were.

But: Atari declared the distribution of RAM-based TOS versions illegal a few years ago. So, if you have such an old no-ROMs machine, use it legally. But you won't be able to get a TOS boot disk from your dealer (if the latter has read his mail, that is :-)

No, that was just a typo. Sorry for that one. It should be "per minute", not
per second.

The "real world" backup speed of an Archive Viper 2150S is 4 MB per MINUTE,
hooked to an ST, TT or Falcon system with fast hard drive (this is necessary to
keep the tape drive streaming).

The Archive Viper 2525S does about 11 MB/minute (oops, just typed /s again :-)
The fastest one I've seen so far is the HP 37480 DAT, which does about
15 MB/min, but only with VERY fast drives on Falcon or TT. The ST can't keep it
streaming, no way.

bye, Peter

1588. MIDI software for sale

Newsgroup: comp.sys.atari.st
Date: 1994-04-25 22:27:57 UTC
From: sxp17@po.CWRU.Edu
Message-ID: <2phg5d$pgc@usenet.INS.CWRU.Edu>
Source record: 188432

I have the following original disks for sale :

BAND-IN-A-BOX ver 2.2; Everyone probably knows what it does, but - it will make up 'intelligent accompaniment' to the chords you enter on the screen. It will play this accompaniment through your MIDI device in a variety of styles which you can choose (Hard Rock, Light Rock, Bossa Nova, Country, etc .). There is a piano display on the screen that shows what it is doing, also . . . Also included is a Fake Book disk with 50 popular songs from all styles. $20 US + $2 shipping.

PRO-MIDI by Eidersoft. I spent very little time with this program- I know that it loads sampled instrument sounds through the ST and allows you to play them via ST or MIDI. It displays the graphic waveform content of these sounds, also. It looks very impressive . . . make offer.

MASTER TRACKS, Jr. by Passport. This is a 16 channel simultaneous record/editing/playback sequencer. It has 4 main windows (Song Editor, Transport control, Track Labeler, and Conductor). I'm not sure how many tracks it has- I think 24 total. Very nice, but I'm ready to go pro level . . . Make offer.

Thanx.

To the best of my knowledge and sources, Richter lost the rights to the GFA Atari code in a falling out they had with GFA Systemtechnik. And since the latter has no interest in pursuing the Atari market anymore I don't think we will ever see another GFA BASIC for this platform (IMHO).

I still prefer GFA over HiSoft Basic Pro but at least the latter continues to support the Atari (including the Falcon and MultiTOS, supposedly) so it is worth looking into.

While some of the command syntax is the same or very similar, generally GFA for the ST and GFA Windows are _not_ compatible. This is primarily due to the huge difference between GEM and Windows. GFAW does have the power to create screaming fast Windows apps, but be forewarned, you will need to learn all about the Windows API to make use of it. GFAW is fast, but it has none of the GUI design tools ala Visual Basic and the docs are still poor.

GFA for DOS is much more akin to GFA ST but it's not as good a product as GFAW. Too glitchy, too slow, still no true compiler (although one is promised RSN) and you have to worry about the DOS 640K memory barrier. Duh.

> Is there anything out there that can do the same with the ST and
> MAC?

No. However there is a very capable and powerful BASIC for the Mac called FutureBasic which I highly recommend. I don't use Think C anymore. :)

Regardless of the legality issue, you might not be able to use that TOS 1.0 floppy once you get it, anyway. Depending on which system you are using, you will likely find that it will not boot properly. There were (are?) a couple of PD TOS-loaders available but I never could get them to work on my MegaSTe. You might have better luck, of course.

Best solution for ST owners is the CodeHead TOS Extension Card (or a similar product) which allows you to have two TOS chip sets installed and switch selectable.

Apple reportedly offered a $150 bottle of champagne to any application publisher who could break the 680x0 emulation on the PowerPC chip. Rumor has it that the bottle is still up for grabs. :)

There have been, however, scattered reports of "problem" programs on the PowerPC. Namely, those that bypass traditional Mac programming channels. RAM Doubler, for example, and OptiMem are two programs which I've heard scattered reports of crashing, but that's about all.

```

> It's even faster than movem. But, I clears only 185 in one frame, at 50Hz...

I don't know what you mean by '185', but the above code won't work since the 'dbf' instruction branches until the value in 'd0.w' goes negative. Your expression '320*200-1' yields the value 63999, which in twos complement is already a negative number (-5537). So your dbf will exit the loop after copying 1 longword.

>P.S.: Has anyone got something better ?

Does the 68030 have a 'longword' version of 'dbf'? (I don't have docs handy) Perhaps two 'dbf' loops one after the other? Each handling half the total required? I assume loop unrolling doesn't gain much on the 68030 with it's cache enabled?

Cheers, Steve

>

I find this very surprising. From what I heard there was a crash for
any Mac program in which the machine language had been hand optimized,
as the emulator was essentially a "Mac-C" emulator, as opposed to a
Mac-Assembler editor. The emulator was so rushed, and so under-manned
(1 person did it), that the approach he took was to emulate code generated
by one of the only two official c-compilers used by developers.

But this is hearsay. The FACT is that Apple has brought in nothing to
emulate FPU calls, nor due they plan to. This meant that right out of the
box, NONE of the cad programs, modelers, or rendering packages I tried
would work. (This was of the program's choosing, of course.)

ALL of them said they would NOT run without an FPU, and of course, the PPC
doesn't use one. So here's a very significant problem as it effects most
68K power user applications! And this info is first hand, NOT hearsay.

After a long discussion on the topic with Apple representatives, the best
advice they had was that they had heard of a software patch that was many years
old, used specifically for fooling programs into running on Macs without an
FPU. They recommended emulating that program first. Unfortunately, my chances
of finding such a hacker tool are nil.

BUT this is not about MACS, other than to point out that the emulation is by
no means complete.

I'm sure they could find SOME use for the blitter... to move things while the main processor is doing other things? How about have the CPU generate the text string (VDI or GDOS), tell the Blitter to move it, then before it's done, return to the calling program. There are lots of things you can do when you try to make things run concurrently.

I've been fooling with copying/clearing memory on the Falcon myself. One thing I'd like to point out about that code sample is that clr.l (A0)+ should be faster than move.l D0,(A0)+. Why didn't you use clr.l?

Anyway, I can't seem to get my code to be fast enough, and unrolling loops on the Falcon DOES help, strangely enough. If you have, say, 8 of those clr.l's in a row before tehe dbf, the overhead of the dbf becomes negligable.

Can anyone give me code to move memory FAST on a Falcon? I need to be able to move 153600 bytes in under 1/60 second. Can anyone write code to do that?

You could get Mag!X which is a multi-tasking system much faster than
MultiTOS. You will then have effectively upgraded your TOS version. Unlike
Geneva, Mag!X full replaces TOS. The best upgrade will be to get more RAM.

>- I heard about harware extensions for the ST (68020 or 68030 cards). Are those
> solutions bound to a particular Tos-Version? Do most of the old Programs

> a card and would you say that this product is good ? How much will it cost ?

There are 68000 cards running at speeds of 16MHz to 36MHz. You can also
get 68020 and 030 boards, but I think these require TOS 2.06. Another way
of speeding up the machine is by getting NVDI the graphics accelerator, it
is _very_ good.

>- How much Ram can I add to my ST ? How much will it cost ? Are there known
> problems with Ram extensions ?

Up to 4MB normally, but there are some boards that get around this limit
up to 12MB. Some old games will not work.

Greetings, Timothy...

(This hasn't anything to do with the above topic, but I'm not quite comfortable enough yet with this newsreader to change the topic and know it'll still get sent...)

Anyway ... there's something I've been meaning to ask you for some time about ANSITerm. I'm currently writing an ANSI editor (actually it's just about to be released) based on the same sort of idea that ANSITerm works off of -- a 4x8 font in low res. Now, do you actually replace the system font or are you using a screen font? If it's a screen font, how do you get it to update each character so quickly? I've found that with the way I do things in Fansi (my ansi editor) I have to plop down the screen font (inherently in black/white) then overlay the colours pixel by pixel based on the user's selected colour attributes. And in GFA, isn't isn't especially fast (though I do use low-level Line-A -- PTST and PSET -- to achieve this) I do a lot of fiddling about to speed things up, but underneath all the enhancements is still an inherently slow draw engine. Is there a better way of remapping a screen font character with new colour attributes?

(Hmm. This message would be a good testament for the c.s.a.programmers newsgroup...)

it's really too bad. it's an exellent work your e_gem, but a short describiton
for each function and their parameters would really be helpful. i allready spent
a lot of time finding a function and how it works in the different source files
maybe you could add some more examples p.e. how to iconify a window, ...

] I just got the demo form my ST Format mag, looks pretty good, i played
] around with it a little but have to wait untill i get some free time to
] experiment more. Its by Virgin/Sensible Software, they make some pretty
] descent games.

Unfortunately, it has NO support for additional memory, and the palette routines are a bit dodgy as the colors in the startup-routine are using the 512 color palette specifically, so things look VERY dark on the STE! (The poppy takes a couple of seconds to work out.....)

The game itself is brilliant though, except, the scrolling is also badly done, and there are a couple of small bugs such as a character sliding around for long lengths of time if he 'slips' on ice at the same time as a grenade is thrown! No samples either. The amiga version was quite a bit better, but it's nonetheless a very addictive and quite playable game! (If only they'd done the scrolling _properly_! :(

] My understanding is that there are several STE-enhanced games (that is, the
] do more when run on an STE, but will also run on STs). The Chaos Engine
] is supposed to be one. Can anyone name some others?

Chaos Engine looked, played, sounded exactly the same on my old STFM as
it did on a friends STE. The colors were brighter, but that's just the
STE's higher color output.

Hmmmm, Lethal Xcess, Wings of Death are both STE enhanced, what else...

Frontier (4096 color mode? It may be STFM as well.....)
Magic-Boy (Haven't seen it on an STFM, but the music is definately in
Stereo, and those colors.....!!)
Utopos (STE Only!)

Populous II was supposed to be, but never seemed to be.

It's pretty poor really. How difficult is it to detect the DMA chip and
re-route music/samples through that. It's EASY! Only a couple of lines
of code in virtually any language. But programmers rarely bother!

Still, I'd rather have my STE than the STFM! It's much nicer to use! :)

The Problems with STZIP 2.5 is not to do with extracting files
into directories..

But there is a button to let you create a Folder/Directory
in the Zip or Disk, the disk one does not work, it comes up with a dialog
box stating unable to find folder....

This option is very handy to set up a TEMP folder to extract in...

Hutch,

That isn't true. What is important to know is that Basic 4.0 is not
GFA Basic in name...it is downwardly compatible to GFA Basic 3.5 or 3.6TT
code.

I've seen the new interface and a little of it in action..however
to be quite honest, even though Richter ist still pursuing it..it doesn't
look like it will be finished...the real problem is the motivation factor
considering the atari market in Germany now. (Still better than in the
U.S.A. of course)

Cheers

Hello,

I phoned Richter Distributor yesterday to get some information
about Basic 4.0, what time it will be out and if ever.
I was told (by Richter himself) that he could not give me
exact information, because he did't really knew for himself.
Fact is that Basic 4.0 is not given up yet, but because of
the bad market situation the programmers are not on
a high motivation. He told me that there were three
programmers, one only for direkting the whole thing. One of
the programmers gave up, so there now just "one and a half"
persons working on it.
As Richter sayed, he has now hard contract to the programmers
and money is not the reason why they started the new version.
So he can't make pressure on the programmers but he hopes
that the things happening around Atari at the moment
("Fez a Bit" in Berlin or the CCS) will give some new power.

Another point is, that Version 4.0 is nearly ready, the
interpreter is running, but they had to built it
completely new. But Richter also told me that the compiler
is not running yet - it was not able to give a "Hello World"
yet.

I hope that I could clear some things with this statement.
And I for myself really hope that the new version will
come out.

Alex

CEO file contents:
Hi,

You'll find a complete hint file on aminet (the amiga's archive) which has
a mirror on umich.edu. You can also look up in comp.sys.amiga.games where
Frontier comes up quite often.

Combat techniques with pause-target-autopilot-fire have been described already
35,256 times so I won't start again :) BTW don't you think it's a bit stupid
to have to pause the game if you want a decent chance of survival.
In fact there are quite a few annoying things in this game. Like the copy
protection thing (I have the original, but it took me 5 days and 50 crashes
to figure out that my french version thinks its on an english keyboard !)
I also can't manage to get the target icon on the system map. (bug?)
Hey, even the french translation of the docs is buggy : ECM in french
becomes an "Electronic measure counter". Ever tried counting measures ?:)

Even with this the game is GREAT ! Keep on coding Braben ! :)

I haven't managed to land on a planet either with the autopilot. Haven't even
tried in manual with this damn thing. I do miss the easy flight of the good old
Elite I Cobra Mk III. I guess the autopilot drives you into the ground because
it goes straight to the target and the planet surface is curved. Anybody ?

There is a cool way to start the game directly into the action without trading
for years between Barnard and Sol : Start at Lave, sell all your equipment and
trade your Cobra III for a Moray Starboat (that's the only way to get an auto-
pilot). Then you can try trading/missions on the Lave-Leesti-Diso-Lave line.

Any other hints ?

Nick.

>wait for a couple of months.

Well, I have ordered a hard drive from SS three weeks ago, and was told
I'd have to wait another three weeks yet, as they are waiting for an ICD
Link shipment. And believe me, I am pretty frustrated!

Still, I'll laugh about it all one day! :-)

1639. Mod player/tracker and Stereo Replay

Newsgroup: comp.sys.atari.st
Date: 1994-04-26 11:19:22 UTC
From: bhf@st-andrews.ac.uk
Message-ID: <2pitbq$o0d@calvin.st-and.ac.uk>
Source record: 188330

I've recently bought a 520STFM quite cheaply of a friend. While my main reason for this is to use it as a MIDI sequencer (as it is a _LOT_ better at that than my PC), I would like to use to play MODS.
Now I know that the STFM hasn't the world finest sound chips but I have also managed to get a cheap stereo replay cartridge off another friend. Do any mod players/trackers exist for the STFM that use the stereo replay as a playback device? Is this a really silly question?

Please give me an answer or I will be forced to spend far too much money on a decent soundcard for my PC in order to get my Amiga-owning flatmate off my back about how great Amigas are at playing mods !!

Thanks very much,

Bruce.

From: jimt@motx1.uk.mdis.com
Message-ID: <Cov6Fo.Doq@mdis.co.uk>
Source record: 188313

Hi there!

I have a few questions relating to the Comeau C++ 3.0 compiler
for the Atari as discussed in AEOPJ1.

1) Will the compiler executable run on the Falcon?
2) Will it produce C source compatable with Lattice C 5.6 ?
3) Where can I get a copy in the UK ?

Thanks in advance :-).

1642. Problems with Miniwin/Toswin ....

Newsgroup: comp.sys.atari.st
Date: 1994-04-26 11:29:13 UTC
From: bianchi@engels.co.umist.ac.uk
Message-ID: <1994Apr26.112913.20861@nessie.mcc.ac.uk>
Source record: 188246

Hi All,

I seem to have found a problem with Miniwin/Toswin which I use for running tcsh, mintshel, etc...

After running miniwin the total free memory drops - I'm checking this using the "Desktop Configuration" menu option under MultiTos. I've lost upto 50kb each time I run miniwin !

The same also happens with Toswin (Warwick Allison's version) which I just compiled last night.

Has anyone any idea why miniwin/Toswin 'loose' memory - where is it going ??
The system I have is a 4Mb Atari STE with hard drive, MultiTos (with MiNT 1.09), NVDI, Deskpic (with a nice picture of Tori Amos !), and MinixFS (pl9).

Thanks for any help,
Bye for now,

Andrew.

In the archive lazer_2.zip you should also have ungto.txt which tells you
where to put the bin and mod files, and ungto.prg which kicks the whole
thing off.

1644. CD-ROM and Falcon: Drivers?

Newsgroup: comp.sys.atari.st
Date: 1994-04-26 11:39:16 UTC
From: djs@jet.uk
Message-ID: <1994Apr26.113916.2146@jet.uk>
Source record: 188510

I have not been entirely successful getting my NEC 2xi CD-ROM to work
on the Falcon. The combination of MiNT 0.95 and ICDCDxx.XFS supplied
with the ICD Pro Utilities do not even recognize the drive on boot up.

The Atari driver (v0.7), used with either MultiTOS MiNT 1.04 or
non-MultiTOS MiNT 1.09, do recognize the drive on startup, but then get
`Device has been reset' errors back from read attempts.

I can read the drive sectors OK using the SCSI.PRG program supplied with
ICD Pro (provided I set a buffer size of at least 2048), so I think that the
drive is OK. Perhaps I do not have the best drivers/MiNT combinations?
Any ideas?

(Info: NEC 2xi, Falcon. SCSI-II command set selected on drive.
Termination resistors removed, as drive sits between the
Falcon and a hard drive, although I tried it with the
resistors selected too).

1646. Internationalizing software

Newsgroup: comp.sys.atari.st
Date: 1994-04-26 11:53:19 UTC
From: C.J.Ridd@cs.bham.ac.uk
Message-ID: <2pivbf$t0i@percy.cs.bham.ac.uk>
Source record: 188321

The only text that really *needs* to be hard-wired into a GEM
application is the alert string for 'Resource file not found. Quit'.
Can anyone post the appropriate translations of this alert into other
'popular' ST languages, eg German, French, etc? This should confine
most localization isues to the RSC file, which is easily changed.

Do menu shortcuts change in different countries? The Atari style guide
says to use ^W for closing a window (same as on Mac and Windows), but
most German-authored software uses ^U for close and ^W for cycling
windows ("wechsel" (sp) ?) Presumably the Atari style guide is meant
for English users only?

Thanks!

1651. TRADE: NEC laptop for ST gear

Newsgroup: comp.sys.atari.st
Date: 1994-04-26 12:22:56 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <RQ4tbJg.lmcclure@delphi.com>
Source record: 188319

The following is available for trade for Atari equipment:

NEC Ultralite DOS laptop, NEC V-30 CPU (8086 compatible) clocked at 9.54Mhz, serial port at COM1, internal 2400bps modem at COM2. Backlit LCD CGA resolution screen. Weight listed as 4.4 pounds.

640K main memory, plus 2 megabyte "Silicon Disk" (battery-backed RAMdisk)

DOS 3.3 and utilities (including LapLink) in ROM. Includes 5.25" and 3.5" LapLink diskettes for desktop PC.

Includes external hi-density floppy drive, and all original manuals and boxes. (Floppy drive attaches to the expansion port on the Ultralite, and also provides a standard parallel port...essentially, it is a mini expansion unit).

For the record, I value the NEC Ultralite at $250-$300. Due to a greater need for cash than goods, I would sell it for $250 cash.

If anyone out there is interested, I would trade my 520STe with 4megs of memory, and an ICD AdSpeed STe, plus the NEC Ultralite package for a Mega STe. So, if you would still like to run your ST software, but need a DOS laptop, here is you chance.

OTHER TRADES WANTED: I would also consider taking any of the following in on a full or partial trade for the Ultralite (depending on the item's value): Quantum LPS-series SCSI drives, 15.75Khz-capable multisync, Canon BJ-200 or HP-DJ500, ICD Link, or a bare Syquest SQ105S mechanism (perhaps someone out there is upgrading to a SQ270S and could use a nice little DOS laptop)?

Please reply via email to LMCCLURE@delphi.com

I'm having problems linking files using prospero C. I've created a .LNK
file listing
Program name
Prospero C binary files (inc. CGEM)
My own files
In that order. both of my files compile fine, but upon linking it comes
out with "External not satisfied" and lists all the AES calls I've used.
Does anybody out there have details on how to do this properly? This has
put a decisive brake on my GEM aspirations!

It tends to be rather flakey under TOS, probably due to Atari's silly
decision to use DOS "text" mode for "text" files instead of UNIX "text"
mode.

Under MiNT, it works pretty well (although it would work better if the
math library were sharable... I've got it set up as _three_ files on my
minix partition, with hardlinks for the other "programs"... saves a
TONNE of disk space) although it's incredibly slow on an ST.

> Is there anyone who can help me ?

There's been quite a bit of discussion lately on the DKB-L mailing list
(and subsequently on the new POVGUI-L) about making an official
portable graphical modeller for POV-Ray. Dan Farmer's on the list, and
has been acting as our liason to the POV-Ray Team.

Several (lazy) people have been screaming for an X-based modeller, but I
keep lobbying for a completely portable one, written in C++; then it'd
be a "simple" thing for someone (me? Warwick? someone else?) to write
the GEM parts of the modeller.

It's a pity I can't remember the DKB-L and POVGUI-L addresses, or I
could point you in the right direction.

This would be next to impossible... Under DOS, even simple things like
allocating memory are difficult; the port would be more work than
writing a new one from scratch!

From: bourlon@gla.ecoledoc.ibp.fr
Message-ID: <2pj59p$82g@vishnu.jussieu.fr>
Source record: 188336

The sinplest way to manage holes is :

```
movea.l Ptr_Sprite(pc),a0
movea.l Ptr_Screen(pc),a1
move.w #Sprite_Height-1,d0
.line:
move.w #Sprite_Width-1,d1
.pix:
move.w (a0)+,d2
beq.s .no_plot
move.w d2,(a1)+
dbf d1,.pix
lea Size_Line-Sprite_Width*2(a1),a1
dbf d0,.line
bra.s .following
.no_plot:
addq.l #2,a1
dbf d1,.pix
lea Size_Line-Sprite_Width*2(a1),a1
dbf d0,.line
.following:
```

Eventhough it seems slow, it's already REALLY fast compared to the time taken to think about this routine ! There are at least two other ways: the generated code, which main disagreement is that you can hardly manage the clipping, and a third way, which is a mix between the two previous techniques. But I haven't tried it yet, so...

1660. Re: Falcon screen display

Newsgroup: comp.sys.atari.st
Date: 1994-04-26 13:58:16 UTC
From: js10039@hermes.cam.ac.uk
Message-ID: <js10039.24.000DF903@hermes.cam.ac.uk>
Source record: 188334

This may be a bit naive, but surely: (please explain where if I mess up)

max memory thru-put = min(bus-bandwidth,memory-bandwidth)
bandwidth = max-data-width * max-clock

say for 80ns ram going thru a 16-bit data bus: mem-bandwidth = 12.5M * 2
= 25Mb/s (5Mb/vbl)

on the cpu bus itself (16Mhz, 16-bit), bandwidth = 32Mb/s (6.4Mb/vbl)

Using the cpu (1 word instruction op-code (clr.l (a0)+)
2 words to clear
=6 bytes)
You should be able to do 833333 of these/vbl = 3333333pixels/vbl (in 256cols)

(4 words for a copy = 10 bytes total)
this gives 500000 longword copies/vbl = 2000000pixels/vbl (in 256cols),
still ignoring lower overhead methods like using 'movem.l's

Using the blitter (for a large number of pixels the set-up overhead in
small) this gives 2.5Mpixels/sec copy or clear.

Subtract any amounts for video/DMA/CPU memory contention and this is still
fairly big, so the biggest problem is generating the data to output fast
enough. If you need to do all the fancy sprite manipulation stuff (shufting,
masking ORing data in) then divide the above by 3 or 4, and you should STILL
be able put output 500,000 pixels of sprite data/frame (in 320x200x256col
mode this is nearly 8 full screens of data!)

?

John

1661. Mega ST (4Mb) for sale

: experiences of this piece of kit, good or bad? I have an ICD ADscsi adaptor
: in a big (mostly) empty box with my first HD...

Hi people, person,....

I don't have experience with the 270, but definitely with the LPS240S, and
can say without a doubt that it is a good piece of hardware. Judging on that
I can only advise you that you should go for the 270S. Silent....SCSI2...fast.

However, Quantum have newer drives in the Market, as the LPS range is getting a bit old
now. Nevertheless, good hardware to go for.

}
}> I did some trys to clear a 320x200xTC screen. The fastest way I found is the
}>simplest too :
}> movea.l Screen_Adress(pc),a0
}> moveq #0,d1
}> move.w #320x200-1,d0
}>.cls:
}> move.l d1,(a0)+
}> dbf d0,.cls
}
}> It's even faster than movem. But, I clears only 185 in one frame, at 50Hz...
}
}I don't know what you mean by '185', but the above code won't work since

I forgot the word 'lines'... :-)

}the 'dbf' instruction branches until the value in 'd0.w' goes negative.
}Your expression '320*200-1' yields the value 63999, which in twos
}complement is already a negative number (-5537). So your dbf will exit
}the loop after copying 1 longword.

The dbf exits when your register goes from positive to negative, which
means 0 -> -1. This rout works very fine, eventhough I wrote it here from memory, and I
forgot the division by 2...which you could have corrected, since I must clear a 320x200
screen, with 2 bytes by pixel, with move.l => 320x200x2/4 = 32000, which is positive. But
I'm pretty sure that dbf works even with values up to 65535, since I did it many times...

}
}>P.S.: Has anyone got something better ?
}
}Does the 68030 have a 'longword' version of 'dbf'? (I don't have docs handy)
}Perhaps two 'dbf' loops one after the other? Each handling half the
}total required? I assume loop unrolling doesn't gain much on the 68030
}with it's cache enabled?

It loses a lot. I tried to expand the 'move.l', repeating it the maximum
possible fitting in the cache, which is :

move.w #320x200/2/120-1,d0
.cls:
REPT 120 ( nearly )
move.l d0,(a1)+
ENDR
dbf d0,.cls
```

according that the count is no more exact. It's SLOWER than the previous version, because the data cache it WRITE-THROUGH: it means that each move.l must wait the previous to run. When there is only one move.l, it,s write-cycle is executed during the execution of the dbf, which makes the easiest routine the fastest....

MB.

Source record: 188345

If you want real bi-processing between the 030 and the Blitter, you must
have a 030 code fitting in the cache. And, as the data-cache is Write-Thgrouh, you mustn't write something to the memory, because it will have to wait for the Blitter to give the BUS back to the 030. In fact, it's what I think.... Anyone disagrees... (I know the HOG mode too,
but it's still NOT bi-processing).

Could someone give me code that is able to move memory that fast? I haven't been able to write it myself. The code I write has been banged on for a long time and discussed with many people, yet the fastest I can seem to move memory will move 1.9 meg/sec (I think), but this just isn't fast enough. In order to get the speed I want, I have to move 9 meg/sec, but I'd be satisfied with 4.5 meg/sec. Moving 4.5 meg/sec will animate an entire 320x200 TC screen at 30 fps. Right now, I can only do 15 fps, which is NOT fast enough.

Also, could someone give me enough information on the blitter in the Falcon to be able to use it to do memory copying and other such blitting things? If necessary, I'll use the Blitter and the CPU concurrently, or even use the Blitter in HOG mode.

In HOG mode, does the Blitter completely take over the bus, or does the CPU get any system time for interrupts and the like?

Tell you what... When I get a chance, I'll write my own code to draw characters for both interleaved and byte-based 256 color modes. (I'll make the byte based work in TC mode to test, then recode for 256) I'll see what I can do and which is faster. We can compare code until both routines are best optimized.

I have already posted about scrolling on the Falcon. It has nothing to di with the structure of the screen memory... it can't... it's just moving memory, and there's no more memory for interleaved as byte-per-pixel. The problem is that the Falcon has its screen memory in main RAM, so the access time to it is horrible... you just don't have the bus bandwidth to move screen memory that fast.

Someone else just bought rights from me to use my character drawing code in his BBS. The code is fast because it's a highly optimized assembly routine with unrolled loops and the works. In addition, there are three character drawing routines in ANSITerm... one to draw one character on a character boundary, one to draw two characters on a two character boundary, and one to draw 4 characters in a 4 character boundary. These are used together to output text as efficiently as I could conceive of when I wrote ANSITerm. I know now how I could have eliminated other overhead, but it's too late for that.

I don't think you could get VDI to use a 4x8 font... or if you can, I don't know how, but I can guarantee, it wouldn't be fast enough.

If you want to buy a lisence from me to use code that will draw characters fast, maybe we can work something out. Send me email at tmiller@suntan.eng.usf.edu.

1671. Bare SCSI Hard-Drive to Falcon - How?

Newsgroup: comp.sys.atari.st
Date: 1994-04-26 15:28:12 UTC
From: u9019448@qub.ac.uk

: as a grenade is thrown! No samples either.

Has anyone experienced the game crashing ?
I've had it crash about six times now, three times after I'd managed to
struggle my way to the buildings on Mission 8 Phase 3.
It usually crashes when I'm firing a weapon and get killed at the same time.
- another crash point was on Mission 7 Phase 3 (I think - (the one where you
have to leave the eskimo intact)). It would crash whenever I swam across the
water to kill one of them rocket launcher blokes.
The most depressing thing is that you can't save inbetween phases
- when it crashes you have to restart the whole mission....

A Bloody excellent game though !!

Dylan

P.S. I'm on Mission 8 Phase 3 at the mo' - does anyone know of any tips/
supa dupas around ?

I got the PowerUp2 32MHz accellerator at the Newcastle atari show, 50 (UK)
from System Solutions.

The speed increase isn't that great, but hey - for 50 (UK) what can you expect.
I don't think that the Eagle 32 would give much better results as it also lacks
a cache or on board ram, so you are very limited in what you can achieve -
I seem to get only around the 15% improvement mark.......

More interesting though is that I also saw the Baracuda 040 board for the falcon
at the same show - a 32 MHz 68040, on board RAM up to 64Meg, a slot for an
off-board video card (away with bus contention forever....) and all small enough
to fit inside the standard falcon case.

Anyone out there know how to build a Jag Joypad compatible joystick for my f030?
I downloaded Llamazap from a.a.u.e (what was it doing there anyway - isn't it
comercial?) and I want to play, but I buggered if I'll spend 25 (uk) on a
joypad just to play one pre-release version of a game (even a Jeff Minter).

Craig.

I seem to remember that some of the Quantum devices did not have a jumper
to set parity. You had to do it with a weird SCSI command (from a machine
that could handle parity). Your ADSCSI should be able to handle parity
with no problems, but you might want to consider getting a unit with a
physical jumper anyway (in case future uses of the drive require parity
changes).

1688. How do I check the font proportional flag ?

Newsgroup: comp.sys.atari.st
Date: 1994-04-26 17:07:09 UTC
From: perot@iris.amp.uni-hannover.de
Message-ID: <1994Apr26.170709.25404@newsserver.rrzn.uni-hannover.de>
Source record: 188516

Hi guys !

In the header each font features a proportional flag indicating whether the font is proportional or non-proportional. I just can't believe that a VDI programmer does not have legal access to this flag. Is there any way to check whether a particular font is proportional, apart from comparing the cell widths of each character ?

I think most of the trackers have this feature. Be sure to get Protracker ST 2.0 (on atari.archive.umich.edu). It is the best tracker I have found, both for ST and STE.

> Please give me an answer or I will be forced to spend far too much money on

I have never heard the output from a Stereo Replay, but I can tell you that the output from an STE is MUCH better than from an ST without stereo replay. Amigas are good at playing mods (somewhat natural for this to be true).

Oh, for zillions of great mods, check out wuarchive.wustl.edu in /systems/amiga/aminet/mods/*.

I paid about $125 CDN for the Mega ST TEC bus board that was pretty much a snap
to install. It's a little more tricky if you want to run your existing TOS and
TOS 2.06 but it's not that difficult. I believe I got it from Gribnif
(413-247-5620). There are others out there as well.

Martin Wevelsiep has developed RAM expansions for the ST series... Depending
from the board rev. you can get up to 10 or 15.5MB fully compatible ST-RAM.
I think he also has something similar for the Mega STe.

You can reach him as martin_wevelsiep@ac3.maus.de, as far as I know.

Source record: 188530

Hello all,

I'm staying in residences at university and so don't have enough room
to bring my own printer with me. Luckily my friend has offered to let
me use his Cannon Bubblejet (the small protable one, can't remember
the number: BJ10e ???)

Anyway, he has asked me to see if I can find a printer driver for it
for use with his favourite (and only) word processor 1st Word Plus.

If anyone knows where I can find this using FTP then please let me
know or if you have a copy of the driver code then please mail it
to me.

Thanks

Barry

> over to the PC. Don't forget that the PC versions were developed after
> the Atari versions so compatibility was most likely retained.

True. This is of course assuming *.LST format files.

However, there are a few things to watch out for...

Atari-style comments using "!" at end of rows will not be recognized, e.g.

a=1 ! atari comment

will import on the Windows version as

' ==> a=1 ! atari comment

In other words, the entire row will be commented out. If your code has been commented in this way, the easiest fix is to do a global search and replace, < ! > for < // >, note leading space so as not to strip logical variable tags. Going the other way is no problem, since the Atari version recognizes // and /* style comments on a row and changes it to !-style.

There are a few variations on "standard" commands which will surprise one and not be recognized in the Windows version. From memory, I believe that function calls without brackets is disallowed,
' ==> a=FN funky
(must be defined and used as FN funky() instead)

' ==> ABSOLUTE a,*b
(not possible at all)

and so on. In general, one must after import do a search for the ==> tags to correct the more obvious problems, redo any system specific calls (which were cleverly tucked away in one-off procedures/functions, right?), and then seriously review the code with regard to variations on version limits to variables and arrays, Intel-format number storage, what have you.

It is by no means as bad as going to another BASIC, but I would not want to redo a larger program under stress...

Howdy,

As previously posted by Jeff Weiner, I will be taking over the management of the Atari archives at Umich. I'll be posting some FAQ's and stuff in the near future. I believe my goals are similar to Jeff's, in that I want atari.archive.umich.edu to continue to be the best ftp repository of Atari software in the world.

Please take the time to thank Jeff (weiner@terminator.rs.itd.umich.edu) for his years of service to the Atari community. The Atari archives at Umich are largely responsible for making my Atari computer purchases something other than an expensive mistake. I have no doubt that others feel the same way. Jeff, thanks a zillion!!

Hmmm, I wonder if the IRS will let me write off a Falcon now, for testing purposes . . . :-)

1702. Edith Professional Desktop Text Editress---Beta Testers

Newsgroup: comp.sys.atari.st
Date: 1994-04-26 19:56:39 UTC
From: avg@cwi.nl
Message-ID: <Covu2G.LHv@cwi.nl>
Source record: 188210

The final beta version of Edith, the text editress, is ready for
a small distribution. We (speaking on behalf of ZFC, not my employer
mentioned below) need a few more, EXPERIENCED, beta testers.

Especially interesting are the following configurations:

- Terabytes of memory in order to test Edith on large files
- Eagles, Medusas
- A machine with only 512K of memory
- People who frequently work in ST or TT Low resolutions
- People making heavy use of minix file systems
- People who regularly edit binary text files
- Extremely naive users (proof required---if your request comes
through e-mail without trouble, then you are not our wo/man.)

Please reply to this message by e-mail if you are interested. Please also
do so if I promised to send you a beta but failed to do so :-)

Thank you,

Annius Groenink.

What do you mean? The stuff from SONY?

I don't think they sell it yet...

And even if they will some time - the Data MiniDisc uses an own, fixed,
filesystem - similar do CD-ROMs.
So it won't be usable at all with an Atari, until there are drivers (like an
XFS for MiNT or someting).

Yup, get 1meg SIMMS (you may need SIPS, which are harder to upgrade - the
early ones used these).

It doesn't matter if you get 8 or 9 bit SIMMS - the extra bit is only
used by PC's for parity checking - the ST just ignores the extra bit.

The ST accesses memory at 150ns for <2megs, and at 120ns for 4megs - so
anything less than 120ns is fine.

Years ago, I worked with a guy named Mikeal Hunt. Strange spelling,
but everyone called him Mike. So one day I walked into the
secretary's office. She was a staid, polite woman in her forties,
and she smiled at me and said, "Hi, have you seen my cunt?"
Or that's what my ears heard, anyway.

I stared at her for a full minute, trying to think of an
appropriate response. Finally, I said, "No, I haven't seen
Mike Hunt."

Then I turned and ran out of there.

hmmm, i own just this machine (mega st4, T36, SL + NVDI) and the
system-performance is only a little bit under a normal TT.
i am waiting for the 'multiboard' from the same developer (german company heyer
& neumann) providing TOS 2.06, 2 SIMM-sockets (for normal pc-simms;
1Mbit/4Mbit) and a graphic-card adaptor for normal PC-ISA ET4000 cards.
costs about 300,-deutschmarks (~ 180 us$). available in june/july 94.

Ciao, Arndt.

: I've seen some files popping up around which have something to do with MiNTNET, what is that. They are packed with a strange extention (I don't remember which one, TGZ?).

I don't know about MiNTNET, but it sounds interesting. TGZ is the filename standardization of .tar.gz (tarred then Gzipped) Under unix, it is likely that you type 'gunzip {filename}', but I have forgotten the command for tar. I think you have to tell it not to use a tape drive by default or something.

I think GEMAR on the Atari will TAR/UnTAR a file for you, although I have never tried it.

>hich one, TGZ?).

I think thats:

TAR + GZIP

So you need a copy of both these programs.

Un GZIP the .TGZ and rename the output as .TAR

Then run TAR on the .TAR file.

At least I *think* thats what I did!

:-)

Has anyone here done any interfacing to the ROM port of a 1040 ST FM
(or other machine .. same port I presume) ?

I've been looking for a 20/20 edge card interface to the port that I
could use to connect to a solderless breadboard.

Other than etching one myself, anyone know of a source for this kind
of thing?

Mike

What, are you going to get on my back for doing something perfectly reasonable? If you can'd do something yourself, you pay someone else to do it. It's not like I'd charge him anything significat... just a token amount so he knows I'm serious. He said he couldn't get it to be fast. I could. Therefore, if he wants me to help him, he'll buy use of my code. Simple. If you want to write your own, that's fine with me. If he wants to write his own, that's also fine. If he wants to use my code, he'll have to pay for it. That seems perfectly reasonable. If I do work, I want to be paid for it. I spent months figuring out different ways of drawing characters before I finally came up with what ANSITerm has. I'd like to see YOU write a terminal program as fast as ANSITerm 1.91. To you and I NOW, it's a simple problem. I could recode it in an hour just because I type slow, but that's after having figured it all out. Figuring something out can be the hard part when you have no experience with it.

Sounds straight-out wrong. The 68030 isn't really a very complex chip.
I could write a simple emulator in a day. The tricky part is making it
run FAST. Making it WORK is easy.

Especially since any program written in C will be simply recompiled for
the PowerMac - only those hand-written in assembler will be left emulated
(eventually).

Yawn. Old argument. With bitplane modes, you don't have to draw on all
bitplanes. This isn't much use in a general graphics environment (eg. VDI),
but with direct access, all sorts of amazing effects are possible.

1720. Help finding Hybrid Arts/Barefoot Software

Newsgroup: comp.sys.atari.st
Date: 1994-04-27 01:28:03 UTC
From: messina@duke.lanl.gov
Message-ID: <MESSINA.94Apr26192803@duke.lanl.gov>
Source record: 188110

Hi,

I'm trying to get ahold of Hybrid Arts/Barefoot Software.
I own a very old copy of SMPTE track and need a more modern version.
I've been trying to reach them for a while.
The last number I have is from the May 1993 issue of EM.
I've tried calling it and get the message that the number is being changed
and there is no info on the new number.
This message has been on there for a while.
I've tried calling information, they have no info on Barefoot software.

So, I am stuck with this old copy which syncs to SMPTE flawlessly,
but has no graphic editing environment at all.

I fear they are dead.
If this is true does anyone know where I can get a more modern version.

Also, does anyone know if any other sequencers work with the Hybrid Arts
SMPTE box.

Thanks for any info,
Mike

>The figured I heard claimed that the GEMulator wasn't even up to ST speed on a >486-66.

It all depends on various factors. The cache size, the amount of RAM (GEMulator will use virtual memory for ST RAM), the graphics card, and whether you're running under DOS, Windows or OS/2. can all make big differences in performance. I should be getting my GEMulator this week. I have a 486DX2-66 w/256k cache, VLB graphics card, and 16 Mb of RAM. When I get it, I will test it out under all 3 above OS's and post my results.

The GEMulator will run at about the same speed as a MegaSTe when run on a 486DX-66. There were some problems with running a clock doubling Intel chip, but I believe this has been fixed.

Everyone should realize that there is NO hardware support for the ST/STe with the Gemulator, so you can only expect TOS apps to run sucessfully. With the price of used STe's (I just sold a MegaSTe4 for $250) there is no reason to get one of these items UNLESS you want to run Calamus or something on a PC at work.

] P.S. I'm on Mission 8 Phase 3 at the mo' - does anyone know of any tips/
] supa dupas around ?

AFAIK there are only 2 supa-boostas before Mission 9. Both are on
Mission 8, Phase 3!

1:

Bottom right of the map and then to the left a bit is a tree, (looks like
a fern). Blow it up and there is a Missile Boosta which gives you 50
heat-seeking missiles. Another bug appears here, sometimes if a squad
member is killed, or you split up the group, the missiles revert to
standard bazookas!

2

Top left of the map, (accessed by a path near the bottom left), there is
a palm tree with a Rank-Boosta under it. Makes a trooper an instant
General!

Anyone found any others? 'Secret' areas?

They do exist (there's one called C-Breeze and one called C-Envy I
think), but I have no idea how they work... They're probably quite fine
for learning C syntax (pointers can be hell until you figure them out,
especially on a machine without memory protection).

> I've just started to dable with Sozobon C which is PD, my version is pretty

That's pretty much the definition of a good compiler. If you grab Heat
& Serve C 1.33i (hsc133i.*? on atari.archive? down in Languages), it's
a decent C compiler, with nice GEM libraries.

Well, I've a name to top 'em all. This poor guy was one of my high school classmates. A lot of people didn't know why he called himself "P.V." We all assumed it was because we wouldn't be able to pronounce his true Vietnamese name. I later found out his true name (hence the initials) was "Phuc Vu". I swear I'm telling the truth. I remember our history teacher was calling role for the first time and he got to Vu's name: "Uh, this guy's last name is Vu..." I don't know how he kept a totally straight face. Needless to say, PV spoke up quickly.

>joypad just to play one pre-release version of a game (even a Jeff Minter).

Llamazap on atari.archive.umich.edu is an incomplete beta copy of
the game from January 1993 (the game wasn't finished until about
6-8 months later). Yes, it IS surprising to see it there, but
unless the SysOps at a.a.u.e KNOW it's a commercial game, they
can't know that it's illegal to post. Maybe someone should tell
them.

I don't think SCSI MiniDisk data drives have been released yet,
but a SyQuest 3.5" drive is a much better deal -- MiniDisk
barely even equals single-speed CD-ROM drive performance!!!

Hi there,

Can anybody suggest any good FTP sites, with Atari Fido software
available. I've had a look at ftp.tu-clausthal.de and
ftp.uni-paderborn.de already, but am looking for more than what they
have around. Any suggestions??

Cheers,

The value that your called function returns *used* to be
mis-documented, I'm not sure if the new manuals have been corrected.
At any rate, check the example code for rc_intersect() to find the
real behaviour expected!

>apart from comparing the cell widths of each character ?

No, that's the only way to do it for bitmapped fonts (not a big deal
really, you're only comparing 256 numbers). For Speedo fonts, there is
a flag in the font header which you can get from the VDI in a legal
way (using vqt_fontheader())

1747. Re: Bare SCSI Hard-Drive to Falcon - How?

Newsgroup: comp.sys.atari.st
Date: 1994-04-27 08:50:12 UTC
From: PostMaster@barclays.co.uk
Message-ID: <Cowtvo.L6I@barclays.co.uk>
Source record: 188122

Remove the ICD interface from the drive and get a cable to connect between the SCSI II port on the Falcon to the HD. Depending on what sockets your HD case has, you may need to run a ribbon cable from the drive itself to the casing which terminates in a SCSI 1 type connection. Then you have a cable that connects that to the Falcon. Should cost about 20-30GBP all in. Most places that sell Falcons should be able to furnish the required cables.

1748. Quartet to ???

Newsgroup: comp.sys.atari.st
Date: 1994-04-27 08:52:49 UTC
From: rgibson@cs.strath.ac.uk
Message-ID: <2pl952$19e@dunlop.cs.strath.ac.uk>
Source record: 188121

Hi, I posted a request for any info on transfering quartet .4V files
to some other format (ie any other format at all) and got zilcho
response - a big fat zero :-(

So does anyone have layout of how Quartet saves its files ?

OR has anyone already written a program to translate Quartet files
to another format.

OR does anyone have an email address for Microdeal and I'll try them.

Any help welcome.....

Ronnie

From: derose@i30fs1.ira.uka.de
Message-ID: <2plcpq$rbr@nz12.rz.uni-karlsruhe.de>
Source record: 188125

Dear Folks,

I am using the Pure C 1.0 compiler from ASH with my TT030 for 2 years
and I am very happy with it. Now I heard about a new version (1.1).
ASH informed me that it will cost 50 DM (~ Us$ 30) but they not
say anything about the new version (new features ?).

Did someone already used it ? Is it the money worth ?

Regards,

Cesar

>I find this comment a little disturbing David since you sold me your
>copy of Calligrapher Gold V.3 about a month before Calligrapher was
>on that cover disk. You knew I wanted it for my Falcon too. Hmmm..
I sold you Calligrapher in January. I got my Falcon in February, so I
did not know that there were problems at the time. Working Title had
said some time ago that it would run OK, so I sold it in good faith.
As you know by now, Calligrapher does work OK in 2 colour mode, but not
in colour modes. If I had known this at the time I would have warned you!
(Changing screen modes for each program is a real pain).

I only found out that the cover disk version didn't work properly from
someone else; until then I hadn't installed it because I didn't want it
any more.

>...I've never had any problems with the
>postscript driver yet either (which you were saying you had to hack
>around!) I admit it produces Postscript files that are absolutely
>enormous and I feel like hacking it myself too but only when I have
>the time.
I fixed some bad character mappings. I don't have the fixed driver any more,
I think. If I can find it, I'll forward it. I did not fix the
rounding problems that cause very bad PostScript drawing of non-builtin
fonts, as that would require knowledge of the proprietary font format.

The other big problem with the PostScript is that, for non-builtin fonts,
the characters are individually drawn with a batch of moveto/lineto directives.
This means that the character bitmap cache in your PostScript interpreter
is not used, and files get very large and print slowly.

>BTW. I noticed that on my version your name pops up on the info. dialogue
>box. Did Working Title do that at some point when you registrated
>your version?
Yes. When I bought Calligrapher I got a limited version. You then have
to send this off to get the proper version, which had my name stamped on
it. You have all the original disks and manuals. And, as I promised, I
did not keep any backup copies at all, so your version is perfectly
legal etc.

>in a big (mostly) empty box with my first HD...
I have the Quantum LPS270S, although it's connected to the SCSI-II port on a Falcon rather than to a ASCI->SCSI adaptor. It works well, and is pretty fast (better than my old LPS105S).

There was one problem which I did not resolve, although I think it may have been a software funny: When running DA's Picture, and using a partition on the Quantum for the virtual memory, the drive would sometimes `stick', and take 30 seconds to respond, during which the whole machine would freeze up. Switching the virtual memory to the internal IDE drive fixed the problem, which makes the Quantum suspect. However, I have not noticed such sticking problems with any other software, so it may have been DA's Picture's fault. Who knows?

Sony presented their MiniDisk data at CE-BIT (german-computer-show) some weeks ago.
I heard that it should be on the market at autumn this year.
The latest C'T-edition (german magazine) had a short description included.
i don't now if a SyQuest 3.5" drive is a much better deal
- i heard with MiniDisc data you can also play and record the normal MiniDiscs
(so if you work with sound datas you will be able to store much more than
with a SyQuest)
- the MiniDisk data medium (120mb) will cost ~50DM
a SysQuest (115MB ?) will cost 150-200DM (i'm not shure about the SyQuest-prices)
- the discs are little
...

> the right direction? (I need a FAX number, if possible.)

Well, the phonenumber to the support BBS in the US. is: 801-756-2901

But don't hope for too much, I ordered a copy of RATSoft on the 31/12-93 and
haven't seen or heard anything since then. The Author of RATSoft doesn't
answer my mails, the former Sysop on the support BBS didn't answer my mails.
The current sysop doesn't know anything!

The way they are handling their new customers really SUCKS!

Another Sysop I know has been waiting for his copy since February this year.

I had this exact problem when I started using a link file. It should
be like this:

Program name
<link flags>
CFIRST
<your files>
CGEM
CLAST

(or very close to that)
email me if you want me to send you a working link file.

cc103@city.ac.uk (NORMAN S L) writes:
>Have you got any example code though?

Yes, well it depends what you're redrawing obviously. Say you're redrawing a dialog in a window (not uncommon, nowadays), and your object tree is called 'tree' and is positioned correctly (that is, ob_x and ob_y are at the window work position.

```
int tree_redraw(int winh, const GRECT *r)
{
objc_draw(tree, 0, 8, r->g_x, r->g_y, r->g_w, r->g_h);
return 1; /* it might be 0, check the the documentation */
}
```

Is that what you wanted?

I generally use "tar -xfo filename.tar" on the unix box here,
and "tar -xf filename.tar" on my Atari. The "o" in the first one
I think sets the file ownerships to you on extraction...

As for gzip, I think the syntax is "gzip -d filename.z"...

Tim, I think why he got annoyed is that generally the folks on the
internet (particularly those involved in the various aspects of
Gnu-software) work under the concept of free and shareable software,
thus why the source code for so many things (like MiNT) is
available to all. I'm not sure he was trying to "hire" you to
do the code somuchasto simply ask for help/examples. I could always be
wrong though (as I have the knack to be at times ;-)

The internet is a whole world unto itself (watch the reactions
people get when someone is trying to sell something commercial
over the net - like for instance the "green card" dude from
a couple weeks back - major flamage goes on)...

Oh well, life goes on (and on and on... :-)

This is true. Or if ya got a couple bucks to spare each month,
you could always hook into one of the services like GEnie or
Compuserve. As long as you stay out of the general chat lines (not the
Atari RTC but the online games, etc) your bill won't be that bad,
and you'll have access to a number of developers, etc (and, oh yeah,
what's his name again? uh... Bob Brodie ;-)

There are also some internet accessing BBS's, so those are always
another way to go. I agree though, the net is a nice place
to learn...

Not stupid. Most FTP sites that do that sort of thing support
on-the-fly compression. Just try getting stzip.tos or whatever (instead
of stzip.tos.gz) and you should get the uncompressed version.

FYI, it probably said something like that when you logged on... ;-)

Nope. I'm kinda starting work on an HTML gadget for GEM++; that'll make writing one trivial (since I'll be using libWWW straight from NCSA) at some future point.

I'm also looking for something that will do sockets over a SLIP connection or something like that; keep your fingers crossed and maybe LYNX (the WWW browser, not the hand-help game thingy) will appear soon.

>and that didn't include a Sound card. Which would cost alot more to compete
>against the Falcon.. The Falcon does have 50khz Stereo sound. Which I haven't
>seen on the IBM yet...

There is one Dealer in the whole of New Zealand that has a Falcon with a
65 meg hard drive, the Price is about $2700nz plus 12.5% Tax..

The Monitor will bring you back some 600-700 Dolars and a good size
hard drive will set you back some $800nz-1000...

This looks like a total of $4400nz...

A PC 486 DX2-50 with a 170meg HD will set you back $2599nz plus tax,
with Windows and MS DOS 6.2..

I can walk into 3 shops around here were I live and get Software support for the
PC clone, there is no support for any other computers...

There are some 50-60 Shops around Wellington that Support PC Clones some Mac
shops and 3-4 that support the Amiga, 1 or 2 for the Acorn and one shop
in a suburb that has one Falcon that has not been sold in 4 months..

I can walk in to most of these shops and get help/Support and I can try out
before I buy..

This I can't do with the Falcon at all, I can't even get a Ram upgrade, so why
should I get a Falcon..??

I have been using Atari computers from 1979 from memory and I still have 3
Machines, STFM/STE and a Mega ST2....

But what pisses me of is the Atari Bigots that can't look further than there
nose..

Atari OZZ came over here to try and get Dealers to sell the Falcons, no one took
this up at all, there are no Atari agents here or in OZZ...

So chaps suff this in your pipe and smoke it, before you jump down my throat
again....??

Hi friends

Got this tape backup unit connected to my Atari right now, and it connects to the printer port. Now, is there any way I can perform a backup? Gemar 2.20 is only for tape thingies that plug into the DMA/SCSI port.

Anyone know of any other PD/Shareware software for this. The tape drive connected is a trakker 250 MB.

I'd also like to test gemar to put on our archive, and this is not much help at the mo. 8(

BTW, micros.hensa.ac.uk has gone back to it's old machine, as the new one crashed and rebooted after the first hour. We are still waiting for SUN to come and fix the problem. Hopefully, the new machine will be on-line by Friday.

Thanx in advance.

You've just shot yourself in the foot again. You tell us about how crappy the
ST scene is in NZ and then extrapolate that to mean all Atari lovers must be
a bit odd.

If I was you in NZ, I'd have a hard time justifying my purchase but I don't
live in NZ, I live in Europe where I have a wide range of Atari software and
hardware available at good prices, only a phonecall away via mail order or
sometimes from a local shop. Within walking distance, I have 5 shops that
sell Atari software, 1 that sells hardware and 1 that has some US jaguars.

Am I an Atari bigot for still liking and using my machine? I must admit, if
someone asked my recommendation for new machine, unless it was for MIDI I'd
probably recommend something else. For me though and many hundreds of
thousands of others, Atari is the right machine with the right software.

I suppose this is what you meant:

> Mint/Network:
> total 592
> -rw-r--r-- 1 30516 230181 Jan 31 20:07 net-022.tgz

It provides network support for programs like Telnet, Rlogin, Rwho, FTP, NFS etc.
which use sockets for communication between the server- and client processes.

Unfortunately those programs still have to be ported for the ST with MiNT &
MiNTNET. Recently I noticed NFS, but I haven't tried it yet (I soon will :-)

Here's how to xtract .tgz-files:
gzip -dv *.tgz
tar xvf *.tar

Best regards,

Ronald (Yep, same name & same place)

The STEs external sync line is contained in the monitor port. If an
signal is present on this line, the video chip is synchronised with the
external signal.

In <CoBM4t.38x@rahul.net> wilsont@rahul.net (Timothy Wilson) writes:

>Yes, I'm a real falcon developer, I wrote Sonovisa which is currently
>selling, I specialize in graphics, and have written texturemapping
>routines, and know how to use the DSP.

OK, I know another couple of real Falcon developers, who can program the DSP very well, and write very good texture mapping routines. Let's compare notes...

>A few Things to note:

>1. The blitter in the falcon is slow, A tower of movem.l's is faster.
^^^^^
A "tower of movem.l's", eh? Haven't you heard of the cache on the 68030? On the 68030, a "tower of movem.l's would actually be slower than a semi-tower of movem.l's in a dbf loop!! (as long as it's just under 256 bytes long.) Anyway, to the main point about the blitter.

Well, the blitter is only really good for bitmap graphics, and wouldn't be much use in true-colour mode anyway. There's also 68030 specific bitwise commands, and I have been assured that using these commands in conjuction in the 68030 with the cache is actually quicker than the blitter on the Falcon. I'm not exactly too sure about it myself. (Perhaps anyone can inform me otherwise?)

>2. The 256 color mode in the falcon is *worthless* for texture mapping.
> It takes 8 word writes to change one pixel to any value.

Not necessarily. If you organise your pallette carefully, you could use sneaky plane tricks so that you don't have to write to all 8 planes everytime. Again, a bit academic, since I think it would be better to do a "Doom" type game in true-colour, but I think a lot of demo coders who have coded texture-map routines on the ST might be surprised to see that you think that a plane mode is worthless for texture-mapping.

>3. True color is a lot better, since you get 1 word/pixel. However, its
> that WORD write over the standard VGA *byte* required that slows it down.

Funny, I thought the Motorola 68000 series took exactly the *same* time for word and byte writes!

>4. the DSP isn't much help either. Why? well it only has 32k of ram
> total to use, And transfering textures is done over the same slow bus.
> The DSP could do 3D transforms, but its not gonna help texture mapping.

Ummm, 32K ram? Are you sure you don't mean 24K-words? Secondly, it works in parallel, therefore the second part of the data can be calculated whilst the

first is being transferred back. And thirdly, I have *seen* texture-mapping routines which use the DSP, particularly a texture-mapped "face", which uses made up of over 700 polygons. (Running at around 25fps in true-colour lo-res)

Another point that I have noticed is that although there is a lot of texture mapping in Doom, all the movement is in *one* plane (perfectly horizontal), and all the rotation is around *one* axis (perfectly vertical). It doesn't take a genius to work out that this can cut down the 3D calcs and texture mapping time a fair bit, since there are no awkward angles to work out. Also, I know an Amiga/PC programmer who suggests that even the rotation in Doom has a slight element of cheating in it! (ie sneaky table precalcs.)

>5. Wheres the money in it? Hey, I like the falcon and atari, but I can't
> see the point in porting stuff to the falcon. In the case of Sonovista
> The Falcon was suited perfectly to the application. And we sell
> Falcon and software bundled together.

A lot of point 5 is based on the "evidence" in the other points, much of which I take issue with anyway. As it is, I see a very good reason for porting stuff over to the Falcon, and here it is: *shorter* *development* *time*!!!

How could a decent "Doom" clone that uses the capabilities the Falcon be not perfectly suited to it?!?! And anyway, who is this "we"? There are Falcon developers other than yourself!

>In the end, a person could port Doom over with everything, sound,
>graphics and such, but it would be too slow. So slow that it would
>be unplayable.

Um, calculations around here have been around the order of 10fps for 320*200 true-colour mode. That's not too bad! :)

>As and example, a 386-16SX had 1-2 frames a second, and
>maybe got to 8-10 when the screen was shrunk all the way down to
>its smallest setting. (80x60?)

I think that might be because it's got an Intel Inside! :) :) My Amiga/PC programming friend has a 386SX 22MHz, and he can't even do stuff on it that he could do on an 8MHz ST. He says the achitecture of the 386 chip is not even quarter as good as the 68000 on his A500.

>This has been my professional Opinion.
^^^^^^^
Oh! Not just an opinion, but an Opinion!

Well, this was my unprofessional (but reasonably well informed)

- O - P - I - N - I - O - N - !! :):):):)

>If you want to play Doom on an Atari, buy a Jaguar.

Don't worry, I think some of us are going to buy a Jag anyway! :-)

Michael.

Does anybody know about a programm which is available on ST & PC which enables you to install a little network on two computers via nullmodem?
Filesystems of PC and ST are quite the same so it should be possible to acess the PC's drives from the ST.
I'm experimenting with using a small mailboxprogramm on the PC but thats quite complicated...

I haven't noticed any of these bugs, but I have noticed the following.

During the animation for a colony on Alpha Centauri it displays garbage at the bottom and top of the screen.

It likes to rename files or at least forget about them, irritatingly enough in the middle of play.

The worst of all. It caused my hard drive to go offline during game play. This has only happened once but was annoying enough to pass on.

Other than that it is terribly addicting. Luckily the errors happen infrequently enough (for me at least) to just be irritating and not fatal.

MBB>Rally (or something similar). Does anyone know if these (or any
MBB>other STE-only) games were released?
MBB> My understanding is that there are several STE-enhanced games (that
MBB>is, they do more when run on an STE, but will also run on STs). The
MBB>Chaos Engine is supposed to be one. Can anyone name some others?

Sleepwalker (form Ocean I think...) is an STE only game which is allready released as a budget title in the UK. There's also a very good Shareware STE only game from Finnland, called Utopos.

STE enhanced games are for example the Shoot'em Ups Wings of Death (Thalion) and Lethal Exess (Eclipse). Both use blitter and DMA-sound and probably hardwarescrolling. Stone Age (Eclipse) is a puzzle game using STE enhanced DMA-sound.

rtlawson> Case? There is plenty of room in the case. I don't know if I should
rtlawson> get a completely new drive or add one to the one I have.

I've got an ICD controller (not sure about the model), and I recently added
another hard disk.

- split the power supply cable (I used a ready-made adaptor)
- made a new SCSI cable (old one was too short) with three instead of
two connectors (50-pin IDC - make sure you get the orientation right)
- configured the jumpers on the new drive for the right SCSI id
- pulled the termination resistors on the new drive (I added it in the
middle of the cable)
- mounted the drive and connected the cables
- tried it out

It doesn't get easier than this.

Greetings,

Jens.

>First (and most annoying): My autopilot doesn't seem to want to
>land on planet surfaces and only in stations (is this a bug or
>a feature?)

If you select the *planet* for autopilot, it flies you straight into the ground. If you select a *location* on the planet, it lands you there.

This is the expected behaviour.

Zoom in on a planet by double-clicking the "zoom in" icon to see the places you can land.

>Second: I have never been able to hit a ship by flying and targetting manuel
>while having engines on.

Of course not. Think a bit about it: "manual" allows you to manually set your desired velocity with respect to the target object. If you try doing this with the other ship as the target, Frontier will constantly be accelerating or decelating in random directions to try and adjust your speed with respect to the other ship; and exactly how it does this will depend upon the angle you're at compared to the other ship.

The net result is that you get very confused very quickly, and the ship repeatedly whizzes past you far too quickly for you to get a shot at it.

Even worse is if you have your target object as your destination, in which case altering your speed doesn't help matters at all.

The right thing to do is to switch off engines and thrust manually, manoeuvring exactly as though it's a 3D version of "Asteroids". You'll find most enemy ships will become big enough to see and shoot at, and will stay that way.

I can't hit anything with the engines on, but I'm pretty vicious with engines off and manual thrusting. Thing is, you want to thrust towards the ship to get close enough, then when it tries to dodge away, stop thrusting and stay at a roughly constant distance from it, sweeping your lasers across it until it dies.

>Third: After my first smuggling I've never been able to smuggle again
>without being caught : Does anybody have some other experinece by buying

I've seen several posts which mention that the AdSCSI can handle parity.
I seem to recall having to disable parity on my Maxtor 7080 to get it
to go. Can all AdSCSI(+) adaptors handle parity? My board certainly
doesn't have any jumpers on it which would enable/disable this feature.
So how does the board know when it's talking to a drive with parity
enabled? Or am I just using an old out of date AdSCSI+? I'd certainly
feel better with some sort of integrity checking going on between drive
and host adaptor, even if it is only parity!

Cheers, Steve
